THE MIND-BENDING STRATEGY
BOARD GAME OF OTHELLO!

ROAD TOAD £5.95
THE BEST FROGGY GAME FOR THE 64
BAR NONE!

CATACLYSM

WORD FEUD

£7.95

This brilliantly conceived program combines the best parts of arcade games with the best of educational games, making a real family game that anyone who can see the screen can participate in. You have to find the word that is hidden twice in the jumble of letters, then guide your sights over one of the occurrences of it.

The first to find it wins! You can play by yourself or in teams against the computer, or against other players. Three difficulty levels are included to suit young and old alike!

NEW

BURNIN' RUBBER

This best selling game for the VIC 20 is now available on the 64! Featuring the most intelligent and devious monsters you have ever tried to avoid, the Bonzas this game is a real joystick wrencher. Move him, the handyman, up and down the ladders to pick up the boxes from the different levels. But don't meet a Bonza on the way!

NEW

BURNIN' RUBBER

Pure shoot-em-up arcade action for the 64 and unexpanded VIC! The Lunar city of Emiam is under attack from the ships of the Jovian empire. Their merciless bombing will reduce your city to a pile of rubble, unless you can hold them off. You are the commander of the sole laser defence base. Your mission - hold out for as long as possible.

You are an entrant in the great Intergalactic Four Seasons Death Race! You must tackle the Spring, Summer, Autumn and Winter sections with the objective of running as many other cars as possible off the road. The opposition is numerous, including the indestructible but slow Tank Cars, the tricky Deathmobiles and many other Demon Drivers. You have one advantage, your car can fly for a limited distance allowing you to avoid hazards if you're quick enough! All this and more makes Burnin' Rubber the car race of the century!

Publisher's guarantee: There are no mistakes in this magazine except this one.

POKEing around the Vic

You can get lots of interesting effects just by PEEKing and POKEing around your Vic. Here's a compilation of those awful and/or interesting memory locations and what you can do with them, straight from the editor's new book.

11

The Forth page: Audiogenics's Vic Forth reviewed

Richard Hiss gets to grips with the two Forth cartridges available from Audiogenics, one with and one without 32k memory.

Screen scene for Vic

Our regular roundup of games goodies (and baddies) for the Vic.

Victuols

This month's offerings from readers include Critical Mass - a screen-based version of the Explosion board game, and Higher Lower, a game for card sharps.

Microtax reviewed

If you have trouble working through your tax return, a program that helps you through the labyrinth might be a good idea. Microtax purports to do just that. How did it fare under scrutiny?

Word processing road-test: WordPro 3 Plus 64

WordPro is an established WP package from the Pot world. Chris Ouzham tested the newer version for the 64, and finds out whether WordPro's longevity (exemplified by the name!) is a strength or a weakness.

Butterfield on 64 video: Part 3

In the penultimate part of his insightful tour of the 64's video chip, Jen looks at the 64's video structure and considers the art of program design.

Pick 'n' mix your extra 64 commands

Getchip #4 from Whitley Computers is a Basic commands cartridge for the 64 that extends restricted old Commodore Basic. But you don't have to buy all the commands available - you choose what you want.

Spreadsheets: business 11s and whals for the 64

Xen Ryder's been looking at a range of spreadsheets for the 64 and more with Abstract and Potomac. Next month, he continues with Kando's well-established Calcibus and its 'Easy' sibling.

Graphics editor packages for the 64

Quick and easy access to the 64's colour, graphics and sprays? Too good to be true? Mike Todd checks out a number of programs claiming just that.

The £1,000 Competition - third and final part!

Easy to enter, easy to win - our competition to win a thousand pounds' worth of goodies for your Vic or 64 reaches the end of the trail.

Profile: Lightning strikes ...

How do the latest computer games get on to your dealer's shelves? Usually through a distributor. Lightning is one of the biggest games distributors around. Bohdan Buciak went along to find out how it runs.

Introducing COMAL

Largely unheeded so far, the COMAL language is a serious alternative to Basic. Comal enthusiast Brian Granger introduces it and runs through its facilities.

Write Away

The Great Vic-vs-64 Debate goes on, and on, and on... Plus more of your letters.

POKES

Straws in the wind

by

Henry Deckhand

One of the problems with playing things as closely to your corporate chest as Commodore does is that people tend to fill the previously abhorred vacuum with rumours.

At press time, the following stories are running round some of them mutually contradictory, including those we are fairly confident about.

We wouldn't advise you to hold your breath waiting for any of them to come true, even if substantiated by an official Commodore statement, given the company's recent history for changing its mind.

The already announced 264 may be launched in the UK before the US, because of problems it's encountering with the American FCC, the agency responsible for ensuring, among other things, that your micro doesn't screw up the neighbours' radio reception.

UK marketing manager John Haxton did confirm this one, but he was clam-lipped about whether the reputed delays in writing the financial software that will come bundled with the machine were another cause for the hold up.

When it happens - and the original US launch date was this month - it is said that the 264 will have 121 colours, a full-travel keyboard, and what is described by Commodore as PA person as "inbuilt software", though whether that means the sort of RAM-resident WP scheduling and similar firmware that have made Tandy's 100 Portable so popular with the punters, they wouldn't be confident say.

Whether those 121 colours are real, or just combinations of the same 16 to which you can get on the 64 via cut out from under wraps, either.

Some reports on the 264 have suggested it'll be a sort of business-oriented 64 competing with Sinclair's QL, but if that is so, why have they given it joystick ports?

However, unlike the Vic and 64, they're not standard so you can use Atari or Coleco joysticks on them.

They do love being awkward, don't they?

About its (presumed) big brother, the 264, even less is known. As in nothing.

However, as you read this, Commodore may be unwrapping not only those two awaited goodies, but also some really powerful business-style machines, including one with UNIX, and at least one IBM-

compatible, possibly plus an IBM-compatible, at the Hannover Fair.

But didn't Commodore have plans for a powerful business machine already, we hear you ask? So they did, and it's been an on-off on love affair ever since.

The news here is that it's on again, in the sense that there'll be 5000 or so of the 700-range machines, as they're called in Europe (or system II, in USA) available here in the spring at a real bargain price.

Well, at £1,895 plus VAT (that's nearly £2,300 tax-inclusive) it may not seem much of a bargain, but look what you get for your two-and-a-quarter grand:

- snazzy 715 machine in Porsche-designed cabinet, with detachable keyboard, including programmable function keys, and 256K of memory;
- equally snazzy 8250 low-profile disk drive;
- 6400 daisy wheel printer;
- SuperScript word processing;
- Superbase database;
- CalcResult spreadsheet.

The snag, apart from the still-hazy price tag, is that the 700 is virtually a discontinued machine, so while there are some attractive packages already written for it (eg from Pischel), there are unlikely to be any more.

Also, while nearly all previous machines from CBM have been upwards-compatible, so that a program written in the late Seventies for an 8K calculator-keyboard Pet will run on an 8596 business machine (though not, of course, vice versa) and it's even possible to reconfigure the 50-column machines to think they have 40-column screens, there's no way to reconfigure a 2000 machine so that it thinks it's a 2000, 3000, 4000 or 8000 machine.

As the man in Commodore's Slough technical department put it so elegantly: "If you think of a way of doing it, please let us know."

Incidentally the 264 is unlikely to be upward-compatible either, which would be really crazy, when you consider what an enormous

software base they'll be disregarding, if this is the way it turns out.

On the dark front there's no news of the hoped for upgraded disk drive to replace the snail-like 1541 for the Vic and 64, though it's reputedly in the pipeline.

Undismayed by the cool response punters gave for the single-drive version of the 4040, the 2031 they have now produced a single-drive version of the 8250 drive, but at a price (£495 plus VAT) destined to turn off its natural market, those who want something more powerful than the 1541 but not ready for twin disks.

Also, it can't be connected to the 64 except via an interface like the Intercept, which itself slows up access somewhat.

On the positive side, though, it is fast, and with the right POKES, can be made to think it's an 8030 so there's a certain amount of compatibility with that now abandoned format, and the wide range of software written for it.

Still on disks, there's no sign of a second drive for the SX64 Portable, though since the gap left where one should be is too small to accommodate spare disks, it's difficult to guess what they had in mind for the space - assuming they had anything in mind.

And if you're a cassette user dismayed that the SX64 has no cassette port - something even the 700 series has had, for all their power - the news is that someone (not Commodore) is working on a way to remedy the omission.

Our lips are sealed until it's up and running, but it should be soon.

Meanwhile, what of the Vic? Everyone keeps talking as if it's about to be phased out in favour of the 64, and some of the people saying it have been from Commodore. Remember the famous Vic for 64 trade-in, which never happened?

It still keeps on selling, and Commodore keep on making them, and in fact the US assembly line's been extended.

Malware wonder how they managed to sell a billion-dollar's worth of it last year, doesn't it?

An unfair levy

The micro business is booming and the music biz is on hard times so the micro business should subsidise the music biz, right?

Wrong? But, surely, you're against piracy, right?

You are? Good. It's reckoned that every computer game sold is pirated at least ten times, so perhaps you think that a levy on blank tapes would help plough some money back in the direction of the victims of piracy.

So, if might, if the people who are proposing to impose tape levies all over Europe weren't totally unaware that there is any kind of problem in the micro world.

This is hardly surprising, since the international lobby campaigning for such a levy is composed entirely of people from the music and video but the International Federation of Phonogram and Videogram Producers, whose report, "The Private Copying of Sound and Audio Visual Recordings" is being used to frame the proposed EEC regulations which will impose the levy.

You will read the report in vain if you're looking for any reference to computer software piracy.

So, even if you think a tape levy might be the answer to piracy and there are some very coherent arguments against it, if the currently proposed legislation is passed without amendment, you could find yourself paying as much as £1 extra per cassette without the consolation that it was at least going towards the production of bigger and better software for your micro.

Instead, you could find yourself subsidising the latest pop craze's same in yellow Rolls Royces. Why the computer industry should be expected to underwrite the fat cats of the inefficient music biz is hard to understand.

The new laws should start coming into Parliament by the autumn, so you've got plenty of time to write to your MP objecting to the proposal.

Royal Warrant sparks storm

We don't know if Ma'am is logging the Royal Coqs feedlines on a database and whether the chosen micro is a humble Vic or a mighty 700 'cos they're not saying, but someone at Buck Hase loves Commodore enough to give them a Royal Warrant.

And has sparked off a mighty row among those who feel that the Royal accolade might have gone ... say ... to a British micro.

Yelled David Broad, chairman of the British Micro Manufacturing Group: "It is sad and disappointing that an opportunity has been lost to encourage truly British manufacturers."

(That "truly" is a nice touch, because as a Buckingham Palace spokesperson pointed out, the Queen's Commodore was assembled in the UK, even if it carries a US trademark. But to continue ...)

We asked Sinclair, who might well have liked a Warrant to add to Sir Clive's knighthood, what they thought, and a spokesperson said icily "We're very pleased for them" - presumably she meant Commodore - "but apart from that we've no comment."

Oxford's games attack

Oxford Computer Systems, originator of the very wonderful Interpod, is thought of generally as a company exclusively concerned with treating the computer as a business tool, an image that will have been heightened by its recent announcement of cross-compilers which will convert 8096 software for the 700, a range of machines about to receive a big marketing push from Commodore.

It has also produced a cross-compiler for the 8000 series of

"business Pers" which results in machine code programs for the 64, and - particularly exciting for the serious programmer, this - a Pascal compiler for the 64, a snip at only £48.95.

However, the business-only image is dented somewhat by the near hysteria emanating from Oxford's HQ in Woodstock, Oxon, about its very first game!

The unprecedented event even infected its usually sanguine PRO, Jeremy Boggs, who issued a near-incoherent press release, pecked with expressions like "is reported to be", "is believed to be", "will probably be" and "expected to be".

What this all adds up to, according to Oxford's Tony Wilkes, is a driving game called "Turbo" (no connection with the fast-cassette LOADING system of the same name used by some of the new games from other companies) rather along the lines of the Pole Position arcade game.

It'll be out any day now (ie early April), will be available as cartridge or cassette, and will cost less than a fiver, which is good for a quality 64 game.

But the proof of the pudding - or the driving - will be the actual product, which we'll let you know about once we've played one out of them.

Currying favour

People like Rumbelows and Dixons thought it was a good idea to add home computers to washing machines and hi-fi. Currys did too, but it set up the Micro-C shop-within-a-shop to deal with business computers and a sprinkling of the domestic version (the idea being that you need specialised knowledge to sell computers - very true, very true).

Now Micro-C has moved out to independent premises and is devoting itself exclusively to business systems (IBM PC, ACT Sinus and Apricot et al.) That means you'll have to wade through the Hoppoints and Hoovers at Currys to get the Commodore 64 or Vic. But Currys tells us there's a member of staff trained to deal with computers at every one of its 900 branches.

"The new Micro-C - away with home computers, in with crown green bowling"

We have a number of reviews, programs, and tips for the VIC-20, the Commodore 64, and the Commodore 128. We also have a special section on the Commodore 64, which is the most popular computer in the world.

Most of the software is for the VIC-20, though there's also a lot for the 64. And some of it is for the Commodore 128. We'll be adding more as we go.

Again, with a good deal of research, we've tried to make this a truly useful guide to the Commodore world.

Apologies

Calendar Sales (namely the lovely Nicky) have asked us to convey our apologies to:

- 1) Readers who've ordered Videotape; and
 - 2) Those who've ordered Tim O'neill's highly-praised book. Getting the Most from the 64.
- The 1-on-1 delay on the Videotapes (it says here) was because there was one or two unfortunate hitches (known in technical language as bugs) and since we reckoned you'd want something that worked, we held things up while we sorted them out.

However, by now you should have received your tape(s), but if not, please ring and shout (but not too loud, since she's got sensitive eardrums!)

3) Meanwhile Prentice Hall, Tim's publishers, were taken completely by surprise by the enormous demand (there's in addition to the hundreds ordered via CUI) so they completely sold out.

This means that some people may have to wait a few extra days to receive their copies until the next shipment arrives from across the Pond.

We apologise for any inconvenience this may cause but rest assured, all orders will be met. Again, many apologies.

Commodore International Computer Art Challenge.

£150,000 in prizes to be won!

The Challenge: Commodore Computers are pleased to announce their first International Computer Art Challenge, and invite entrants to submit their work for judging by June 1st, 1984.

Entries for this important new competition must be generated on Commodore 64 or Vic 20 computers, and may consist of either a still picture or of dynamic graphics of no more than 60 seconds duration.

There are three age categories: under 12; 12 to 17; and 18 years or over. All entrants must be able to demonstrate their skill on Commodore equipment and explain their methods and development of their entry if required to do so by the panel of judges.

Prizes in each of the 3 age groups and the 4 entry classifications (explained in the leaflet) are as follows:

1st Prize: £1,500 worth of Commodore equipment to the winner's choice.

2nd Prize: £1,000 worth of Commodore equipment.

3rd Prize: £700 worth of Commodore equipment.

In addition, winners will have the opportunity to see their work in a series of unique exhibitions across the world, and a special scholarship worth £5,000 will be awarded to one winner in each participating country to further his or her art education.

All entrants will receive a certificate of entry. There are no cash alternatives to any of these prizes.

How to enter: Leaflets with full details of the Challenge and the entry form are available at Commodore dealers, Commodore User Clubs, most major retail computer shops and at stores with a

computer department. In case of difficulty or for additional copies, please write to:

The Commodore International Computer Art Challenge,
Granard Communications, 4 Babenaes Street, London SW1Y 6HD,
using the coupon provided.

Art for Art's sake

"The Commodore International Computer Art Challenge will open up an unexplored area to home computer users." Says John Baxter, Commodore UK's marketing Manager. There's more: "we have a responsibility to constantly push forward the frontiers of technology".

So the Challenge is under way, unveiled at London's Hippodrome nightspot to light shows, booming music, booming speeches.

Absolutely anyone can enter the Challenge, there are three age categories, ranging from under-12s to the over-18s, all competing for prizes worth a total more than £150,000 (sorry, no real money, you just get Commodore equipment). Lucky winners will also get their masterpiece toured round the world as part of an exhibition.

But hold your breath for the Big Prize the lucky winner (only one in each country) will get a £5,000 endowment to enable him or her to study computer graphics "at a prestigious educational establishment" anywhere in the world.

The Challenge is not confined just to this green and hi-tech land; it's crowning whole continents to Europe, America and Canada. But back to John Baxter "we see this as a significant move towards a closer working relationship between technology and the Arts". Perhaps that would sound better coming from someone like, say, the world president of the International Society of Education Through Art.

Enter Professor Brian Allison of the (aforementioned) INSEA. "This major competition represents an important coming together of art and technology which is vital for the future of both subjects." After all, he should know.

closes on 1 June - Prof. Brian Allison and John Baxter, ably assisted by famous TV art exponent, Tony Hart.

Rolf and Tony

Not quite coincidentally, Commodore has launched two drawing programs for the 64. Their respective titles haven't been decided yet but one will include "Tony Hart" and the other, "Rolf Harris" (he of the mammoth canvas, mammoth paint brushes and funny noses).

The Rolf Harris program is aimed at youngsters and has no hires graphics facility. You are the joystick to choose a shape or character (not just the conventional 64 character set) from the wide variety at the bottom of the screen and position it anywhere on the screen. Colours are changed in the same way. According to Gail Wellington, Commodore's software manager "it will certainly cost less than £10 and will be available on tape on disk".

The Tony Hart program does have hires graphics and is much more sophisticated. It will allow freehand drawing and quite a few of the facilities found on computer-aided-design programs. That should cost less than £10 too - you might use one of these for your Challenge entry?

No prizes for guessing who will help judge the UK entries when it

Going for a prize

So what do you do? First of all, your entry must be generated on either a Vic or a Commodore 64. You can produce moving (dynamic graphics) or static work. If it moves, the cycle must be no longer than 60 seconds. Both of those categories have been split to take into account the complete artistic spectrum. So you could produce something abstract (a Picasso, maybe?) or representational (the Mona Lisa wearing a harnet).

Calc Result Turns a Commodore 64 into a powerful professional tool

Thousands of senior managers, sales professionals, scientists, doctors, dentists, business people, barristers, bankers, accountants and other top professionals have suddenly discovered the value of **Calc Result**. Overnight they've transformed their Commodore 64 from a family computer into a powerful, professional tool.

Calc Result is versatile... use it to calculate loan and mortgage payments, forecast budgets, balance cash flow, monitor stocks and shares, plan personal and corporate taxation, check expenses, log and analyse all kinds of bills

Calc Result

offers you a new perspective on financial planning. Our 3-dimensional spreadsheet sums up pages of figures in one easily understood financial model.

Calc Result instantly translates figures into multi-coloured bar charts

Calc Result

has a built-in 'HELP' function. This program actually shows you how to exploit its full potential and versatility.

Calc Result is absolutely accident proof. A built-in program protects your formulae.

Calc Result Advanced

All functions in **Calc Result Easy** plus 32 pages (Three-dimensional viewing). Page add, window, split-screen (up to four pages on the screen at the same time), and help functions. Delivered on plug-in cartridge plus disk. Requires disk drive.

£99-00 (inc.VAT)

For more information contact our Advisory Centre on 0344-778800 or simply contact your local Commodore or Lightning dealer, or clip the coupon.

Calc Result Easy

Single page spreadsheet (64 columns x 254 rows). Built-in graphics. Formula protection, flexible print-out, colour conditional functions and mathematical functions. Delivered on plug-in cartridge. Data storage on cassette or disk.

£49-95 (inc.VAT)

I would like you to send by return post further information on the Handic 64 range.

Thinking ahead

POKEing around the Vic

An A to Z of useful addresses

There are lots of potentially useful memory locations around the Vic, locations which can be addressed directly or from a Vic program by PEEKs that check their contents or POKEs that change their value.

In browsing around we've come across a veritable catalogue of interesting effects. Here's a list of some (in numerical sequence) and what you can do with them; it's based on a chapter from the editor's forthcoming book on the Vic for Penguin.

● INPUT query

Location 18

You don't always want a question mark to appear when an INPUT statement is executed: POKE 18,1 will suppress the question mark.

On the other hand, it also screws up the printing, so you have to reset things immediately after the INPUT with a POKE 18,0 - as in:

```
100 POKE 18,1: INPUT "ENTER SOMETHING": Z$
110 POKE 18,0: PRINT Z$
```

● KILL LISTing of line numbers

Location 22

POKE 22,3 will stop your line numbers from appearing when you LIST a Basic program - could be useful if you're building a manuscript word processor

● End of Basic variables

Location 52

This tells you where variables for a Basic program will stop (the highest limit of memory that they can occupy)

● End of Basic

Location 56

This tells you where Basic stops in memory. Normally it contains 30, and if you get an OUT OF MEMORY error a POKE 56,30 may recover things for you.

● Empty key-board buffer

Location 196

POKE 196,0 will clear out the key-

board buffer, thus avoiding any nasty surprises on your next INPUT.

● Cursor position along line

Location 211

The value in this location indicates the current position of the cursor in terms of number of character positions along the line.

● Quotes mode

Location 212

POKE 212,0 kills the quotes mode; POKE 212,1 turns it back on.

● Line location for cursor

Location 214

The value in this location indicates the current position of the cursor in terms of number of lines from the top of the screen.

● Multi-colour mode

Location 446

This functions like a CTRL-colour key combination - if POKE d with a value from 0 to 7. If you give it a number between 8 and 15 it will display in the Vic's multi-colour mode. Try this sample demonstration:

```
10 FOR M=0 TO 15: POKE 446,M
20 PRINT "VALUE OF 446 IS" M:30 NEXT
```

● Keyboard buffer

Location 649

Location 649 holds the number of

characters that can normally be held in the Vic's keyboard 'buffer', a bit of memory that watches what's going on at the keyboard and acts as a kind of 'type-ahead' store - you can enter a few more characters before the screen has finished displaying what you last typed and they won't be lost. Normally the buffer can hold 16 characters, but you can POKE 640 with any other number POKE 640,0 prevents any input at all from the keyboard.

● Keyboard repeat

Location 880

In its standard form, four of the Vic's keys will repeat as long as you hold them down - INS/DEL for inserting and deleting, the two cursor movement keys, and the space bar. You can make all keys repeating by POKE 880,255, and you can make no keys at all repeat by POKE 880,255 and you can return to normal with the four repeaters by POKE 880,0.

● SHIFT CTRL keys

Location 853

This location indicates whether these three keys are pressed - bits 1, 2 and 3 respectively for the three keys. Use PEEK (853) AND 1 to test for SHIFT; for the CTRL key use PEEK (853) AND 2; and PEEK (853) AND 3 checks for the CTRL key.

● RUN STOP

Location 788

To prevent use of the RUN/STOP

key, POKE 788,194. To get it back again you POKE 788,171. This also stops the TI/T8 clock, incidentally. To kill both RUN/STOP and RESTORE, see location 806.

● SAVE stopper

Location 802,803

Including POKE 802,0 POKE 803,0 in your program will prevent anyone from SAVING it. Kill RUN/STOP and RESTORE as well (see below), otherwise it would be easy enough to reset the system.

Unfortunately the would-be that has to RUN the program first - these POKEs don't work in direct mode. You can get back to normal with POKE 802,243; POKE 803,243.

● RUN, STOP and RESTORE

Location 806

POKE 806,100 will kill the normal effect of typing RUN/STOP and RESTORE together - potentially useful if you want to remove the possibility of someone deliberately or accidentally exiting from your program. POKE 806,112 returns to normal. But be wary with this one. POKEing 806 with other values might well screw things up for good until you next switch off and on.

● Start of custom graphics

Location 7168

If you POKE 36879,305 the Vic will assume you want to use a set of user-defined characters in locations 7168 to 7600 rather than the standard character set.

SHARPEN YOUR WITS!

Sizzling programs to dazzle the mind
from Sulis Software

A challenge from Sulis.

We challenge you to sharpen your wits on our programs. You won't find them easy. Sulis programs are designed to be demanding. But whoever you are, whatever your age, however much or little you know, there's a Sulis program to tax your brain.

Sulis offers a challenge to people who think they can spell and hope to those who know they can't. With **BESIEGED**, **OPEN SESAME** and **BAILIFF**, there are words to suit all ages and spellers—good or bad.

These aren't programs for the lazy-minded—the words are tough, and you have to know what they mean as well as how to spell them. Make too many mistakes, and it's all up—the infidels take the castle, or the thieves do for Ah, or the bank moves in and takes over. It's dangerous work, participating in these spelling programs. Double cassette packs give extra value for money, with 400–500 words and definitions in each program.

Compulsive word games—just **ONE** more round before you finish! It looks easy—you have to put the two halves of the words together—but wait until you try it. Like all the best word games, it's so simple, but it keeps everybody going for hours. Colour and elegant programming help of course, and with 250 words for younger children in **STARTER WORD SPLITS**, and 500 more difficult words in **JUNIOR WORD SPLITS**, there's plenty to keep you occupied.

Fast and furious French—the Sulis way. **JUST A MOT** presents 500 words in French with their English equivalents for you to get familiar with—all of them up-to-date and useful. You learn new words through the games and then make sure you really know them by choosing the key-in option. After that, you increase fluency by turning up the speed. Work from French to English for an easier time of it, and then see how well you can do the other way round. Ideal for travellers off on work or holiday; just the thing for students struggling to get better marks. *Allons-y!*

Travel through time and space with **TIME TRAVELLER**—can you rise to this dual challenge to your knowledge and dexterity? You have to escape through thick bronze age forests, make a getaway from a Roman fort, dodge priests in an 11th century cathedral, flee from 16th century guards, and out-run rats and germs in a 19th century sewer. Keep your wits about you, because you've got to get the questions right as well—chances are, you'll find you have to repeat several ages to amass the huge score necessary to get back to the 20th century. *Bon voyage!*

There's nothing mean in what we offer. Written and programmed by experts, every program is clobber-a-block so that you can use them again and again—and again. (That's before Mum and Uncle Fred and Cecil from next door get to find out about them, when you'll be lucky to get a look-in.)

Pack a new punch with words—there are 1200 to get to grips with in the action-packed program **WORDPOWER**. Play the games to get to know the words, then go for the writing choice to see how well you can spell them. With five different sections, three different activities and two levels it'll be a long time before you exhaust the possibility of this word game. Enrich your language, perfect your spelling, and—talking, writing or reading—you'll never be lost for words again.

Now available from all good software shops, or direct from us:

THE AGE OF COMPUTER LEARNING IS HERE!

Start of alphabet

Location 32776

This location holds the start of the Vic's alphabet in ROM — useful if you want to transfer standard characters from ROM to RAM (7164 on) for customisation.

Horizontal origin of display

Location 36864

This determines how far across the screen the display box is. Normally it's 12. POKE 36864 with a number less than that and it moves to the left; a higher number (up to 22, since that's the maximum width) moves it to the right. Try this:

```
10 FOR P=0 TO 22: FOR T=1 TO 10:
20 POKE 36864, P: NEXT: NEXT
30 POKE 36864, 12
```

Again, the first FOR changes the value and the next one is a timer loop. Line 30 resets the normal screen.

Vertical origin of display

Location 36865

You can get a similar effect for the vertical positioning of the box. The range is 0 to 156, normal position is 30.

```
10 FOR P=0 TO 156: FOR T=1 TO 10:
20 POKE 36865, P: NEXT: NEXT
30 POKE 36865, 30
```

Columns per display

Location 36866

This controls the width of the display box. Normally at 130 for 22 columns, you can POKE a number less than that to restrict the width — POKE 36866 120 gives a one-column screen. Below 120 and above 150 funny things start happening.

Lines per display

Location 36867

Actually 30083 seems to have exactly the same role — they both control the number of lines per display and both are normally set at 46 (divide by two and you get the standard size of 23 lines) or 174 (don't worry about why, but the contents of 36862 are always switching between the two numbers).

To change the depth of the display, POKE 36867 with an even number less than 46. Try using an odd number or one greater than 46 and you'll get some odd effects!

If you ever want stretched characters, this is one location that you can have some fun with. Try POKE 36867 47 then CLR; the bottom border should have dropped out of sight and anything you type now will appear as a pair of stacked characters — so type 'Q' sitting on top of an 'A' (because the 'A' is the next character along in the Vic's character code table). Now you've got one input occupying two character spaces; you can redefine some character codes at 7164 on — but since only 64 characters can be readily programmed and you now need two characters per code you're restricted to 32 new ones. You can then POKE 36869 265 to reference your programmed characters and start printing.

Screen table locations

Location 36868

Three useful POKEs

— POKE 36868, 260 gives upper-case characters and graphics
— POKE 36868, 241 gives that in reverse
— POKE 36868, 242 gives upper- and lower-case characters
— POKE 36868, 243 gives that in reverse
— POKE 36868, 235 sets aside the first 64 entries in the character set as user-defined graphics

With some laborious arithmetic

you also can work out from the contents of this location the whereabouts in memory of your screen table (which holds the 500 or so displayable characters). Normally of course it'll be at 7680, but it might move if you add extra memory.

The calculation in question could be done with this short program:

```
10 P=PEEK(36868)
20 A=(INT(P/16)-8)*2
30 IF P/127 THEN A=A+1
40 A=A*312
50 PRINT "SCREEN TABLE IS AT LOCATION" A
```

Location 36869 can also tell you where to find the character picture table, something you'd need to know if you were defining your own graphics. Again the calculation is a bit complicated:

```
10 P=PEEK(36869)
20 A=P-INT(P/16)*16
```

```
30 IF A/7 THEN A=A-6:GOTO 50
40 A=A+32
50 PRINT "CHARACTER TABLE IS AT LOCATION" A
```

Light pen X location

Location 36870

This holds the horizontal location of a lightpen in the form of a value from 0 to 255. That doesn't correspond exactly to any particular position on the screen, though, and to read it successfully you may have to do some experimentation and calibration.

Light pen Y location

Location 36871

This holds the vertical position in the same way

Paddle A

Location 36872

This holds the potentiometer value from a games paddle, again in the form of a value from 0 to 255. It can also be used for one axis of a potentiometer joystick's position.

Paddle B

Location 36873

As above for the second games paddle or the Y location of a potentiometer joystick.

Tone generator 1

Location 36874

The lowest set of tones you can generate. All tone generators produce a range of three octaves; possible values are 128 to 256 (anything below that gives no sound at all).

Tone generator 2

Location 36875

The middle range of tones.

Tone generator 3

Location 36876

The highest tones.

Tone generator 4

Location 36877

White noise generator.

Volume control Multi-estore

Location 36878

If this location contains a value less than 16, it indicates the volume for Vic's tone generators. Value 0 gives silence, 16 is the loudest you can get. The sound generators produce a range of three octaves; possible values are 128 to 256 (anything below that gives no sound at all).

Anything more than 16 and it's an indicator for an 'auxiliary' colour — irrespective of the background colour, every dot in a character can be in one colour when it's lit and in a second when it's not. This auxiliary colour is specified by the contents of 36878 if they are greater than 16, and you set it by POKEing 36878 with 16 tones a number from 0 to 15 (correspond-

ing to the 16 colours). POKE 36878,16*13 sets the auxiliary colour to light green, for instance.
See also POKE 648
If you want both volume control and an auxiliary colour you have to add the volume level to the POKE — so POKE 36878,16*13+6 would give light green plus a mid-range volume for any sound.

Border background colours

Location 36879

This location has the colour combination for the border and background box of the display. Normally it's 27 (cyan border, white background). Note that the screen-and-border code combinations listed by Commodore tend to omit the reversed-character form — adding eight to any of the usual combinations reverses the display in the box. So POKE 36879,6 gives white characters on a black background with a black border. POKE 36879,16 gives reversed characters on a white background with a black border.

POKE 36879,25 should make the border disappear.

Reposition display

Location 36881

This location determines exactly where on the screen your display box is. The normal value in 36881 is 36 for British Vice (34 in other parts of the world). But if you POKE in a number lower than that the box will move down and a number higher (up to 255) will move it up. This can be used for some impressive effects — here's a short demo:

10 FOR M=1 TO 255: FOR T=1 TO 5
20 POKE 36881,M: NEXT T
30 POKE 34851,38

The first FOR puts successive values from 0 to 255 into 36881, the second one is a simple timer that slows things down a bit. Line 30 resets the normal screen.

Joystick control A

Location 37137

Actually this is output register A,

but bits 2,3 and 4 of the value in this location indicate whether switches 0, 1 and 2 on a switch-type joystick are open or closed (that's north, south and west); and bit 6 indicates the status of a fire button.

Data Direction Register A

Location 37138

Determines the setting of the associated input/output port. POKE 37138,0 to disable the keyboard for use with joysticks.

Joystick control B

Location 37139

Actually output register B, but it handles the east (switch 3) direction of a switch-type joystick. Bit 7 is the indicator bit.

RESTORE

Location 37190

To prevent use of the RESTORE key on its own, POKE 37190,2. To

get it back again use POKE 37190,30. Since the RESTORE key is pretty pointless except when used with RUN/STOP, the POKE 808 dodge might be more helpful to your programming.

General-purpose timer

Location 37199

The value here determines how frequently the VIC goes to its Interrupt Request (IRQ) routine. That in turn decides how fast the cursor flashes, how frequently the keyboard is checked, how the TI clock runs, and other things — including how quickly the processor works.

Ordinarily it contains 72 for UK Vice (66 in some other parts of the world). Setting it to a higher number — like POKE 37199,255 — will speed up the VIC's processing. But be careful: the side-effects are many. Like your cursor will blink slowly, the clock will lose time, and the VIC may miss anything that's typed in. What's more, not all the processing will be accelerated: POKEs and PEEKs will slow down.

DETAILS

Level 9 Computing specialise in high quality text puzzle adventures with detailed scenery and a wealth of puzzles. All games have over 200 locations and a save-game feature and cost £9.90 inclusive.

MIDDLE EARTH ADVENTURES
1. **COLLOSSAL ADVENTURE A**
complete full size version of the classic mainframe game. Adventure with 70 bonus locations added.

2. **ADVENTURE QUEST**
Centuries have passed since the time of Corgias Adventure and the arrival of The Land. With cunning, you must overcome the many obstacles on the road to the Black Tower, source of their demonic power, and destroy it.

3. **DUNGEON ADVENTURE**
The story is completed by this missing adventure, set in the rich caves below the shattered Black Tower. A symphony of humour is essential!

THE FIRST SILICON DREAM ADVENTURE

4. **SNOWBALL**
The first of Peter Austin's second trilogy. The giant colony striding Snowball has been sabotaged and is heading for the sun in this giant game with 7000 locations.

THE LORDS OF THE GAGA
5. **LORDS OF THE GAGA**
congratulations to Sue Gazzard for her superb design of this new time travel adventure through the ages of world history. Conquer the ice age go home, with Gaggas legends, shed light on the Dark Ages etc etc.

LEVEL 9 ADVENTURES

BBC 32K COMMODORE 64 SPECTRUM 48K
LYNX 48K NASCOM 32K ORIC 48K ATARI 32K

Level 9 adventures are available at £9.90 from good computer shops, or mail order from us at no extra charge. Send order, or SAE for catalogue, to the address below — and please describe your micro.

LEVEL 9 COMPUTING

Dept C4, 229 Hughenden Road, High Wycombe, Bucks HP13 5PG

REVIEWS

Adventures which have a fast response time are spectacular in the amount of detail and number of locations and it is available to cassette owners. Simply amazing! — *Soft Sept 83*

"Colossal Adventure is included in Practical Computing's top ten games choice for 1983. Roric and tough as hell. PC Dec 83
To sum up, Adventure Quest is a wonderful program 1983 awarding and challenging. I you like adventures (that this one is for you) — *NUJ issue 1.2*

"Dungeon Adventure is recommended. With more than 200 locations, 700 messages and 100 objects it will test wit and delight!"

"Educational Computing, Nov 83 'Snowball' — As in all Level 9 adventures, the real pleasure comes not from scoring points but in a exploring the world in which the game is set and learning about its details. The program goes to prove that the manual pictures conjured up by a good textual adventure can be far more realistic than the graphics available on home computers.

Which More!, Feb 84
"Large of Time" This program written by newcomer Sue Gazzard joins my favourite series and is an extremely good addition to Level 9's consistently good catalogue. As we have come to expect from Level 9, the program is associated with wonderful style — none of those boring, You can't find me! messages. Highly recommended. — *PCW 1st Feb 84*

Audiogenic's Forth

by Richard G Hunt

Audiogenic has two Forth cartridges, one with and one without 3K RAM expansion. The latter is naturally cheaper, but it requires at least 8K expansion RAM to be resident.

I have to admit that I have been using the cheaper one since it was available first; and, not knowing that what I have since learned about Forth implementations I did not find it difficult to use. That this implementation differs in some respects from what Forth experts like Brodie and Winfield describe as 'typical' does not matter one bit.

Indeed what the creator of this implementation has done is to adapt a Forth system to fit the more unusual (from Forth's point of view) characteristics of the Vic computer. And he has been quite successful.

The Vic is a small personal computer for the home user. The Vic owner is not likely to have a disk drive, perhaps not even a printer. The Audiogenic Forth cartridge therefore compromises with the usual standards - specifically as regards the editor and virtual memory.

This means that certain words (e.g. `VLIST`) cannot be defined. Also this Forth system compiles to machine code which makes faster but certainly more non-standard than most versions of Forth.

Manual labour

The cartridge is accompanied by a 42-page A5-size loose-leaf manual in a ring binder. It is divided into three sections. The first section (Manual) comprises descriptions of the dictionary, maths, the editor, constants, variables and arrays; structure; text and formatted numbers; the

IEEE interface, defining words; interfaces; and so on.

Here it must be said that the text is useful but a little on the short side - because it does not pretend to cater for beginners. (There are a couple of hangups from earlier versions but these are not serious.)

The manual also covers the version for the 64.

Section 2 (Tables) provides a list of all pre-defined words and what they do. Also, there seem to be some omissions in the tables where words listed are described - particularly unfortunate as these tables are the only source of dictionary contents.

There are six special words provided which recognise that

the Vic is different to other computers, notably words that control the VIC chip and the function keys. `[COLOUR]` is one, but it does not seem to function quite as I expected. Its arguments for background/foreground colour don't seem to resemble values to be found in the *Programmers Reference Guide*. In fact the values are `Background * 16 + Foreground` which is then placed in address \$900f. Thus the line

`: paint 16*mod colour;`

enables use of the colour table at Appendix B of the *Reference Guide* without further ado.

The final section of example programs contains information on

how to put some definitions together. These include some printer routines, a `[CASE]` definition for structures (which I have not yet tried) and an arcade game (which I have).

Typing is the game actually taught me much about Forth - especially as it did not `[RUN]` correctly. I suspect a typographical error had caused the number 32768 to be printed. As all Forth students should learn early on, that is larger (by 1) than the largest possible signed single precision number!

Under way

On switching on, the screen displays the usual credits, which promptly disappear when any key is depressed. At this point the non-standard features of the editor become apparent.

To enable the compilation of serious applications comprising several screens of code without resorting to virtual memory on disk, the editor provides editing screens out of RAM - expanding them to fit the screen and compressing them to RAM as required. I imagine it is much like a disk-based system, though the source code is definitely not saved. Screen 0 is the interpreter screen pressing `return` involved the Forth interpreter. On the other screens the return key merely ascends a carriage return.

The small screen size of the Vic is no hindrance. A screen scrolling routine provides a screen of the standard 64 columns by 16 rows. Additionally helpful is an area at the bottom of the screen which indicates

Forth

screen, line and column numbers. Data from the PAD may also be placed here.

What is odd is that for once on the Vic there is no vertical scrolling as the 10th line (of screen 0) is filled. Instead the screen must be cleared by a special word [CLR0].

When using screen 0 users will have to get used to the way in which commands are executed. Execution is displayed by way of a temporary message in text, which is erased when the next key is pressed. I do not find this any more difficult to use than a normal scrolling screen, but it does seem to have some effect on the colour of programmed displays. I have not yet solved how to change the 'ink' colour.

Editor commands are very powerful and are accessed by the function keys. There is no assembler available, though, and I'd guess that a standard Forth 6502 assembler might not work given the method of implementation. Memory maps are included in the manual, however. (All Vic configurations are covered as well as the 64.)

Programs are saved either to

cassette or disk (the latter by specifying [DEVICE] in source code form). Thus to load and run an application one must first successfully load the source code, compile it and then run it; that is cumbersome - and when the source fails to load it is bothersome.

No error messages are given when loading or saving. So when working on a project I load the following two words which I find re-assuring if not helpful.

```
: CLOAD CLOAD 158 C@ 0 =
IF "READY"
ELSE "LOAD ERROR" THEN :
: CSAVE CSAVE 158 C@ 6 = IF
"READY"
ELSE "SAVE ERROR" THEN;
```

The system responds with the inevitable "OK" in any case!

Conclusions

In fairness I think by definition any Forth implementation is going to lack some pre-defined words. Such extensions are easily implemented by the user. After all, that is what Forth is all about. . .

There is not a great choice of Vic Forth cartridges. The Audiogenic cartridge is in my opinion by far the easiest to use unless one is fully equipped with disk drive. Armed with this cartridge and a Forth textbook a beginner may spend hours of enjoyable programming without being

boost with too technical problems.

At £24.95 the cartridge with no memory is good value. The version with extra memory would be an expensive option when a multi-cartridge board or memory board with its own expansion slot would be a more versatile combination.

Our regular round-up of games reviews

We get to see a lot of games here at Commodore User, so many in fact that we can't handle all the reviewing ourselves - we farm out some of them, which is why our reviews have someone's initials at the end of them. We look at everything we get, but we don't necessarily print all the reviews we write: instead, we tend to stick with (a) all the best games we come across and (b) those games that you're most likely to find in the shops or the mail order ads.

ANOTHER VIC IN THE WALL

Vic 20 (Unexpanded)
Keyboard or Joystick
Price £7.00

A variant of Breakout - a black screen and an endless procession of coloured walls to smash through. By hitting the rounded ends of the bar, both direction and velocity of the ball are at your command - but only when you have developed the essential expertise.

It looks deceptively easy to play but in fact is a real challenge. Self-play mode is provided, just in case anyone should decide it is impossible. Obviously the graphics are uncomplicated (small hit-test thought) and the sound effects necessarily basic.

One of my all time favourites I keep bouncing back for more \$8.00 to beat! LS

Bug Byte

Presentation: *******

COSMILADS

Vic 20 (Unexpanded)
Keyboard or Joystick
Price £7.00

This one has been around a long time and hasn't improved it and I'm

sure Bug Byte could and should offer an improved version.

Well, if I must describe this offering - it is *Galaxian* from out of an uninspiring formation of aliens, craft predictably swoop towards your laser base, crudely changing colour en route (must I continue?) to be followed by fearsome mother ships which you must hit several times (goal). The action (sic) commences embarrassingly slowly accompanied by annoying sounds. Your only reward is a ps. trouncing message between games.

Come on, SE. The wrapping looks exciting; improve the game! LS

COSMIC COMMANDO

Vic 20 (+16K)
Stack Light Rifle or Joystick
Price £5.95

Anirog has been providing 16K games for proud expanded-Vic owners for some time now, and is quick off the mark for Stack's Light Rifle, obviously designed for the new hardware, but also amusingly playable with a joystick. We're in a shooting gallery, displayed in perspective. Targets dodge and

weave, inviting destruction, but our shots must count if we are to earn more ammo before exhausting our initial supply - so no wild blasting. On the other hand our bonus score is constantly ticking away. Target snatchers appear along with stealers - and of course the pace heats up. The sonics are entirely appropriate.

Two versions are supplied, with an on-screen gunsight for the joystick variant. Some excellent advice pertaining to loading and cassette-head care is printed on the insert (this should be universal practice). An unusual and effective high score screen adds to the presentation as does the expanded screen. LS

Anirog Software

CYCLONS

Vic-20 +16K
Joystick only
Price £5.99

We are presented with a four-part opening menu giving the choice of four skill levels, fast or slow start, ricochet, and the option of a mountain range. This allows a fair degree of variation, but for my money the ricochet with a mountain range (different every time) makes for the best game.

You have to control a yellow spinning top which has constantly to avoid three whirling red cyclones which intermittently spit projectiles. Your task is to make them collide or to come to grief on the mountains. Alternatively you can flick (definitely not shoot) bullets to the same end. You will need some practice to direct the top accurately, a very delicate touch and disciplined measure of control no longer here!

Then just as you are mastering the situation, a flickering green light, sometimes known as a Pulsar Death Ship, intrudes try and avoid that!

The graphics certainly won't make you gasp but they are

adequate. So are the sonics. On consideration, if they were more complex maybe they could distract your attention from the matter in hand. My NPC (non-computerised friend) reckons "I could really get my teeth into this one". He's just about right. Nice one Rabbit! LS

64-STATSPOWER

STATISTICS PACKAGE

Now available for the Commodore 64, a most sophisticated statistical package. With the aid of 64-STATSPOWER you can become a statistics expert in a matter of hours. Ideal for forecasting, business, home use, schools, students, research workers, hobbyists, marketing, sales, administration, scientists.

The possible uses of 64-STATSPOWER are limited only by your own imagination. Comprehensive manual (with numerous worked examples) guides the novice user through the use of the various statistical techniques - invaluable to students of statistics. In addition, the programs themselves are extremely user-friendly.

64-STATSPOWER has numerous advanced features not to be found on other much more expensive statistical packages. Contents include: ascending data sort, means (arithmetic, geometric, harmonic, quadratic), median, quartiles, semi IQ range, variance, S.D.; mean (absolute), deviation, max and min values, range; measures of skewness & kurtosis; deseasonalisation of data (weekly, monthly, quarterly); log-reciprocal time trend estimation; moving averages (user-defined length); linear and constant-growth rate time trend estimation; chi-square test (one-way classification & contingency tables), sophisticated multiple regression program (options include: dummy variables, user-specified data transformations, user-defined artificial variables, data alteration), regression coefficients, standard errors, R^2 , Durbin-Watson, von-Neumann (with calculated α mean & variance), F-statistic.

mountain range. Humanoids are lined up ready to be defended by a multi-colour laser base. Giant Abductor hawks swoop, soar and dive through a repertoire of several formations to attack your gun and snatch the humans.

The sounds really do mimic flapping wings. Four very accurate abdos are needed to down each bird, causing them to change through cyan, purple and green before tumbling into the mountains. In reply, they drop eggs which hatch into homing moths. You will need quick reflexes and a mastery of a (unique) joystick action to despatch these. After you are completely wiped out it's on to the hall of fame!

Altogether a good game with a most attractive screen display. The user instructions are adequate. With their attention to detail and customer comforts Anirog are again setting standards.

GUN FIGHT

Vic-20 (any)
Keyboard only
Price £4.00

This is a cowboy shoot-out game, in which you have two cowboys on each side of the screen, with each and a constantly moving

wagon you can use as cover.

Each man moves only up and down firing at his opponent. The winner is the first to hit the other man five times, then the game goes back to the beginning.

Being written in machine code makes Gun Fight a very fast game, but once you have got the hang of it the lack of variation in scenery or any progressive difficulty levels makes it under-manding.

The graphics and sound are reasonable, with little gunshot sounds when firing and the death march when you get shot.

SKRAMBLE

Vic +16K
Joystick only
Price £7.95

Wizard! At last a graphically superb arena in which to practice your skills as a Skramble Pilot. Unfortunately my other version of the genre are now made obsolete.

The 16K allows for an expanded screen with very clearly displayed targets resting on the matchwork terrain (no aquaplay). Colourful ammo dumps will return a variable score, displayed on destination. Blue fuel dumps invite your attention, while the yellow missiles change to green on launching! Will you be quick enough to avoid them? The finely-detailed penetrator craft has a pulsating exhaust enhancing the illusion of flight. And a feature I especially liked was the trajectory of the bombs, not just a simple plummet, but a "lobbys" movement, needing that extra touch of skill to aim accurately.

Six colour sectors need to be negotiated. In the red sector rockets have to be avoided or destroyed, inside the green cavern Yo-Yos will plague you. Out on the open again, the blue sector has fireballs (again attractively depicted) which have to be avoided as they cannot be tapped. Over the purple city blocks, still picking up fuel (or alas!) - where you are fighting rockets again. At last the cyan city-maze, only one more sector left and that is as far as I can take you.

No complaints whatsoever about the sonics. But it is the graphics which really impress a visual treat, in fact. With so much to see it's more than likely that I have missed some interesting features. To appreciate the packaging's succinct instructions and a pertinent illustration.

Frank

on, so no disappointments. Need I
add that I recommend it? **LS**

ANIROG

SKRAMBLE

JETPACK

Vic-20 +16K
Keyboard or Joystick
Price £5.50

Early superb space game with a more constructive scenario than usual. You are a delivery-ten pilot on your travels about the galaxy and have the chance to do a bit of prospecting as you go. Of course there's a catch: those pesky aliens are out to get you again (will they never learn?) and there is a little matter of having to assemble your space ship before you can actually go anywhere! I didn't say it was easy.

The graphics are smashing, lots of lovely hi-res stuff as you zip about on your jetpack or go walking on the bits of extra terrestrial flora that appear from time to time along with the goodies like gold, jewels and fuel. Lots of zippy spaces too, phasers lasers and bog bays and more.

Oh I like it, I like it I will say no more but go and get one quick. One or two player option. How do they do it for £5.50? It's companies like Ultimate that get my vote every time. Look out. Imagine, you have competition!

STAR DEFENSE

Vic 20 (+16K)
Keyboard and Joystick
Price £7.95

Defender by any other name, but with a multitude of features poked into 16K. There is an expanded screen accommodating double-width characters yet still leaving room to manoeuvre your craft with superb control from the joystick. Whenever you ease off the thrust there is gradual deceleration, change of direction is instantaneous when needed.

Also to aid you in your quest to protect the purple humanoids from the green landers' smart bombs (RETURN), temporary invisibility (RIGHT SHIFT), jump to hyperspace (SPACE), radar (F3). And lastly you can jump through the glittering star gate to reappear at the scene of another abduction.

Your laser fire is portrayed in multi-colour mode (a Vic forte), as are the mutants which consequently appear to have actually mutated! Great stuff. Auding and abetting the said transnominations are white diamond 'space huns' and green saucers (tricky blighters). Naturally space mines are discharged with gay abandon, so to be at all successful plenty of practice is essential together with a degree of nerve.

To sum up, a program with plenty of meat and a colourful screen display (avoiding the mistake of tiny blue objects in a black sky) aided by a strong sound department. If there is a better version of Defender for our Vics, please let me have a copy. **LS**

Critical Mass

by Keith Edwards

Critical Mass is a two-player game based on a board game called Explosion. It will run on any memory size Vic-20 computer.

You are presented with a 6x6 grid. Each player in turn places one of his counters (either O or X) into an empty square or a square already occupied by one or more of his own counters.

However, each square has a point at which critical mass is reached and fission occurs. Corner squares explode when two counters are on them, side squares explode when containing three counters and central squares go up when four counters occupy their space.

When an explosion occurs the counters on the exploding square are distributed into the adjacent squares. Any enemy counters on the latter squares are captured and become counters belonging to the mover. Should receiving squares attain critical mass further explosions will result.

The player having no counters left at the end of his opponent's move is the loser.

The colours were selected to give good contrast on a black and white television. Users with colour TVs will almost certainly change them.

THE WHALE WILL NOW
ESCAPE FROM A

```
1 PRINT "COUNTDOWN COMPLETE"
2
3
4 STOP
```

by Maurice Le Vellais

A VIC version of an old and simple but riveting gambling game. It will be as familiar to those millions who don't use their TVs for computing all the time, because the game features on the quiz program *Play your cards right* (since last year...)

Playing just involves betting that the next card the computer shows you will be higher or lower than the last one. Put like that, it's not too complicated, but it is surprisingly so. And it's a pretty good adaptation, though there are a couple of flaws - you are allowed to play on even when you've lost all your money, for instance, which isn't exactly good training for Monte Carlo. Still, that's the kind of thing that a home E^{THEN} check could handle.

VIC-20 40/80 COLUMN DISPLAY MANAGER

Just pop this cartridge into your expansion port, and your display instantly goes to the industry-standard 24 lines, with a choice of 40 or 80 characters. Displayed this way, you'll know exactly what you're going to get on the printout. And you really increase the amount of data you can see on the screen!

FREE

**ONLY £99.99
INC P/P & VAT**

PARALLEL PRINTER INTERFACE for VIC-20 or C-64

So easy to use — simply plug-in and print! Includes all cables and connectors to a Centronics Type Parallel Printer. Includes all Commodore Graphics.

£54.95 INC P/P & VAT

COMMODORE-64

VIDEO PAK 80

ONLY £145.95 INC P/P & VAT

Move up to the industry standard 80-column format, and you'll wonder how you ever did without it! Use software control to go from 40 to 80 characters in monochrome — and back to 40 characters in colour. With VIDEO PAK 80, you can take full advantage of the terminal emulator mode and screen print feature with software we include. And this is a great package for word processing — particularly with our FREE WORD MANAGER software and spreadsheet.

WORD MANAGER SOFTWARE AND SPREADSHEET

This software gives your VIC 20 or Commodore 64 capabilities found only in the most expensive word processing programs. Like full function status display, and up and down scrolling plus 13 advanced editing features including margin and block move. In addition we've included complementary mailing list programs. All are written in machine language for fast function and minimal memory requirements. They're self documenting and exceptionally easy to use. A self adhesive strip for function keys makes most commands one-key simple. So simple in fact that we've addressed the need for time consuming manuals and prompts. WORD MANAGER is provided on tape for VIC 20 and C 64, also available on disk for C-64. It's yours free with VIDEO PAK 80 DISPLAY MANAGER.

The following number of cells are available with the following configuration:

VIC 20 8K EXPANSION RAM 50 CELLS
16K EXPANSION RAM 100 CELLS
32K EXPANSION RAM 200 CELLS

PLAN MANAGER performs all basic mathematical functions plus automatically summing and calculating the formulae for all cells. Cells can be moved, changed or deleted. Columns can be set to any width. Individually or globally. The print option prints the full spreadsheet, restricted cells or the spreadsheet model.

PLAN MANAGER was designed to be easy to use and very fast for users who require a spreadsheet for their home and business applications.

PLAN MANAGER is written entirely in machine language handles up to 63 columns and 245 rows, calculates to 11 digits of precision and can be formatted for integer, floating or fixed decimal points. Individual cells are unrestricted and many contain lists, numbers or formulas.

C64 WITH VIDEO PAK 80, 1,100 CELLS

Note — These numbers are approximate and will depend on what is actually stored in the spreadsheet.

NOTE — 80 COLUMN FORMAT REQUIRES A MONOCHROME MONITOR

Send Cheque/Money Order/Bartycard/Access/Mail to:

IMPEX DESIGNS (UK) LTD, METRO HOUSE, SECOND WAY, WEMBLEY, MIDDLESEX M30 9JY TELEPHONE 01-900 0999

VIC 20 — ADD ONS

Vixen RAM Cartridge

Switchable between 16K, 11K, 8K and 3K

Gives you the option of full 16K RAM or 8K and 3K RAM in one package. When added to a standard Vic-20 gives 16384 bytes or extra memory in memory blocks 1 and 2 or 3052 bytes of extra memory into the 3K memory block AND 8192 bytes of extra memory switchable between memory blocks 1 and 3

- Fully compatible with available motherboards/modules
- Simply plugs into the rear expansion port of computer
- No re-addressing of existing Basic programs needed

£34.95

THE VIXEN MOTHERBOARD

THE EXPANDABLE EXPANSION SYSTEM — Providing 4 additional cartridge slots PLUS ROM socket. The slots are switchable, enabling cartridges to be left in place and selected as needed by switching, thus avoiding constant handling and danger of breakage. Having one socket at the rear enables further expansion. Used in conjunction with one or more Vixen RAMs full expansion can be achieved. ROM socket enables ROMs and Eroms to be fitted for future software programs, toolkits, etc. A range of ROM based software will soon be available from the manufacturers. Industry standard Eroms, 2716, 2732, etc. are readily available and easily programmed and copied. A sound investment for the serious user and serious games player which will not become obsolete.

Brass Tax

Is Microtax a help or a game?

by Tony Harrington

Microtax, supplied by Tax and Financial Planning, started life as a cassette-based application written for the Sinclair Spectrum. It has since been translated to run on the Commodore 64; there are versions for the BBC and the Dragon and it is now available on disk as well as cassette. The program has not been rewritten, however, so it still has all the limitations of the original version for the Spectrum.

This article will concentrate on the tape-based version for two reasons: the first is that there are more disk-less 64 owners than there are those with disks; the second is that, speed aside, the two versions are basically identical.

One important point to note is that the version currently available is still geared to the 1982/83 tax year. The supplier claims that an updated version for the year 1983/84 tax year will be available 'any day now' because there have been very few significant changes in tax legislation over the last year that is not too much of a problem.

The package relies heavily on the question-and-answer method, and anyone using the outdated version will have to manually adjust the discs in the screen prompts. The only real changes that have to be made are the altered allowances (they were £1553 and £2445 for single and married persons respectively and are now £1785 and £2795 respectively) and the mortgage limit which was increased from £25,000 to £30,000.

Who's it for?

The designer clearly meant Microtax to be taken seriously as a real alternative for employees working through their net returns on their own. Because it is 'serious', it continually bumps up against the limits of what you can do with cassette-based software. It also raises interesting questions about how far a package-based approach can go towards assisting naive users - since we are not all tax specialists - to deal with something that most of us would rather hand over to a professional accountant.

I must say at the outset that I am filled with admiration for what Microtax achieves, given its chosen medium. A lot of work has gone into producing it and

not much has been taken for granted. There are those who will find it interesting, even helpful. But designing personal tax packages is not an easy business, as we shall see.

Microtax comes in two parts, the program and the Tax Guide. The latter is not to be mistaken for an operating manual. It is no more and no less than a guide to the UK net system. And although the program frequently sends the user back to the guide it is always for a more in-depth explanation of the UK net system, never for additional information on how to operate the program itself.

The Guide is a daunting 137 pages long. Not like

encyclopaedias, you are not expected to read all of it, just the sections the program tells you are relevant to your needs. This comes as something of a relief as most users will not want to plough their way through 137 pages on the intricacies of the UK tax system.

The program is actually a suite of different programs, loaded sequentially. Each one has to be worked through before you can load the next. There are two sides to the tape, both containing separate sets of programs, so be prepared for a long work session (though as we shall see, not every program has to be worked through in its entirety by every taxpayer).

Load and go

It is important to realise that you cannot simply sit down with this package and bang out your income tax. Just as with the manual form, you need to do all the preliminary gathering in of relevant data. In case you've overlooked this, the program tells you as much at the start: "Before commencing we suggest that you gather together as much of the information as possible as listed in Appendix A."

The documents you require are: your previous year's net return; your present net return; your P60 form (the one given to you by your employer showing

earnings for the year, your pension contributions and your tax deductions), the P11D and the P10 (the forms returned by your employer, giving details of benefits in kind (i.e. a company car is the prime example)).

Other documents you need - or might need in certain circumstances - are

- your assessment for 1983/84,
- details of the number of days you spent working abroad;
- details of building society rates paid in 1983 in respect of your house, and details of other loan interest for which you know you get relief;
- dividend vouchers;
- share transactions and contract notes;
- tax deduction certificates in respect of any pensions received;
- vouchers from building societies, banks and so forth, as well as deeds of covenant made.

Armed with all these you are ready to begin.

Well, almost. One of the problems with writing this kind of program is that there are so many factors that it has to take into account. The programmer cannot just assume that whoever buys it will know definitely one way or another whether they should in fact pay UK tax.

Home and away

Microtax has opted to treat in great detail the very difficult questions of whether the user is in fact domiciled and resident in the UK. I know of vastly more powerful personal taxation packages, running on microcomputers and mainframes, which do not attempt to provide as much guidance in this area.

From time to time, because of its subject matter, the program has to use the language of the Inland Revenue and of tax law. This language has nothing in common with everyday speech so the user must be prepared to go backwards and forwards between the program and the tax guide.

Terminology

As an example, when you begin the tax program proper, having answered all the preliminary questions, the screen asks "Do you have any earnings which arise from an office or employment in 83/84? See 8.2". The ordinary lay-person might

suppose that 'earnings which arise from an office means earnings which you get from working in an office. They would be wrong.

That is another tricky area since neither 'office' nor 'employment' has been defined in the tax law. An office is usually referred to as "an existing permanent substantive position which has an existence independent of the person which fills it and which is filled in succession by successive holders". In other words earnings from an office means holding a company directorship or the like.

Employment, on the other hand arises when there is a contract of service as opposed to a contract for service. If you are paid under the PAYE system where you receive your pay net of tax then you can be relatively certain that your earnings arise from a contract of employment.

By now it will have struck most users that one of the features of Microtax is that they will discover a great deal about tax law that they do not really need to know in order to fill out their income tax returns. One way of looking at this program - for all its seriousness - is to see it as another elaborate question-and-answer compuser game.

The program poses to ask whether your earnings are assessable as earnings under Schedule E, or as profits of a trade or profession under Schedule D. If you don't know the program won't be able to help you. It will simply bring you up short at this point.

Contracts of employment

You are now ready to begin filling in your tax return. The first value you are asked to put in is your gross pay, then the program moves on to benefits in kind (i.e. things like whether you have a company car, or whether your employer does other little extras for you like paying the mortgage or your children's school fees).

You can omit the benefits-in-kind section altogether, or omit it for selective contracts of employment (if you have more than one). For those who read it, it is a vital section of the program, since it is one of the most complex to calculate.

Benefits

Next comes the expenses program. All the expenses reimbursed or paid to you have

to be taken into account, and the program is at least useful in reminding you of this fact. These ones include

- motoring;
- travelling;
- entertaining;
- mileage allowances;
- subscriptions;
- round sum expenses;
- free medical expenses;
- loans from your employer at an interest rate of under 15 per cent; and
- getting goods or services below the market rate.

The program goes on to ask about things like pension contributions paid by you through the year. Most of this kind of information you could get off your P60.

This is followed by another program called Working Abroad - a question-and-answer session designed to see to what extent you have escaped the PAYE net by working abroad through the year. If you have or think you might be out of the country during the periods from the 5-4/83 to 5-4/83 or 5-4/83 to 5-4/84 then this section is important for you.

Compensation

Then comes a section on Compensation. The number of people who will buy this program and who will receive compensation for one reason or another through the year can probably be counted on two fingers. But if you need it, it is there.

The final section of Side A of the tape is a summary section, which totals all the values you have input so far. It tells you

- that you are domiciled in the UK (or not);

- what your company car and benefits-in-kind are worth if you have them;

- what your expenses are worth.
- Having done all this, you then have to put Side B of the tape on and only at this point are you ready to begin actually filling tax your tax return!

Side B reminds you once again of the documents you need. Then it works through a mass of questions of the sort that you will find on your tax return form anyway. For example, were you married and living with your spouse during the tax year in question? Did your husband die during this tax year? And so on. It also tells you to do helpful little things such as entering the name

In Business - - -

and address of your employer on your tax form.

The next five sections in the program, headed Return A, work through each of the sections of the tax return form, telling you to put in crosses, values and so forth.

Complications

Some of these sections are more complicated than others. For example, entering the total of life assurance premiums paid by yourself through the year is fairly simple, working out the due on rents from furnished or unfurnished property, on dividend payments and so on, not. Once again, you are here a more quickly through the sections this do not interest you.

I was reasonably convinced this all the things that one normally stumble over in filling a tax form were included in the program. These include everything from building society interests to alimony payments and supporting a permanently disabled child who has passed the home-leaving age.

Microtax then adds up all the information this you have put on Sides A and B and lists them together with the personal allowances. The final program deals with the computation of your tax. At this point you have at last reached the point where you can utilise all those good things this Microtax promotes you on the cover wrapping.

It does a little calculation to see whether if you are a married couple you would be better off electing for separate assessments. It also tells you whether you have overpaid your tax.

It is a fascinating program, better by far than most strategy games. But I couldn't help feeling that using it would take vastly more time than simply filling in the return with as old-fashioned pen.

MAKE THE MOST OF YOUR COMMODORE

Vic Basic

A step-by-step introduction to the VIC 20 computer and its language, Vic Basic. Teach yourself how to use the Vic to create your own programmes, music and art. Also included are puzzles, exercises and games programmes. 355 pages.

The Elementary Commodore 64

A beginner's step-by-step introduction to the Commodore 64. Basic and how to programme includes POKE and PEEK secrets, formatting text, data manipulation, arrays editor, graphics and helpful hints. 230 pages.

★ Our Guarantee ★

We sell books which provide clear and concise information for Commodore users, written by experts.

★ Prices to our customers (inclusive of p&h) will always be lower than R.R.P.

★ Despatch within 14 days of receipt of order or money refunded.

Vic Games

A collection of 30 arcade-style strategy and educational word games for you to write and play. Create your own sound, music utilities and graphics programmes that are real fun. A must for every Vic 20 owner. 183 pages.

The Master Memory Map for the Commodore 64

Full of useful explanations and examples. This book is a guided tour of all the memory locations - places inside your computer that make it act in special ways. You learn lots of uses for the Commodore 64 including how to make music and how to create the special characters used in games. 185 pages.

Word Processing

This is a well known WP package from the Pet world in a new guise for the 64: anyone who has used the Pet version will quickly feel at home.

It comes on a disk which also contains example files. WordPro 3 splits the available text area into two parts; the main text and extra text. You are required to specify how you want the space to be allocated, but you cannot specify more than 329 lines for the main text area - that's about 13,100 characters. This seems rather mean considering how much other packages manage. Files can be linked together for printing, however, so this is not quite the limitation it may seem.

Functions available

WordPro only formats when printing, which means that it needs a lot of format commands in the text. There is a good range of these, and they produce professional looking text. Format commands must be on a separate line from the text and are preceded by a 'format character'; in this case a 'back' obtained by pressing a 'control' key followed by a slash (WordPro uses the CTRL key, the CMM key and F1 as 'control' keys, they all have the same effect and you can use whichever one is most convenient).

There is a Status Line at the top of the screen which indicates the current operating mode. The 'C' on the status line will be highlighted while in Control mode, the T lights up while in Insert mode. And so on.

This is useful, but you must be careful to check which mode you are in as it is easy to overlook the indication. Insert mode, which is entered by pressing SHIFT CONTROL, enables you to insert text into an existing line, the remaining text is pushed to the right to make room. There is also an Insert Line command - CONTROL followed by INST - which opens up one new line for each depression of the INST key.

The Delete Line function is achieved by CONTROL DEL, like the insert function it deletes one full line every time DEL is pressed. To get out of both of these modes you have to leave Control mode by pressing the CONTROL key again.

There is a delete word and sentence function as well. CONTROL 'd' activates it, pressing 'w' or 's' highlights the appropriate word(s) or sentence. RETURN then deletes the highlighted text. An 'Erase' function (CONTROL 'e') provides really large deletions - deletes all the text, 'Y' deletes everything after the cursor, 'T' deletes the range of lines previously set.

Finally, both the INST and DEL keys work as normal to do single character edits.

Block moves are also well supported. The range of text is set by CONTROL 'Y'; you use the cursor keys to specify the range of lines to be highlighted, and the next command determines whether the range of text is copied or moved (CONTROL 'I' and 'M' respectively).

One point that only whole lines can be moved. There are no facilities to move part lines, so you must reformat your lines accordingly by padding with spaces and then deleting them again after the move - boring but workable.

Post-formatted input: what you see is definitely NOT what you get. A typical WordPro screen layout.

WordPro Three Plus: the opening menu screen.

Tab are set using CONTROL 's, the 'backarrow' key is used to move the cursor to the next tab stop. There is a numeric code (CONTROL 's) which has the effect of turning the ordinary tab into a numeric tab. This is supposed to allow you to line up your decimal points with ease, what it in fact does is to move the numerals to the left of the tab rather than the right. You still have to line up your own decimal points by ensuring that there are the same number of digits to the right of the decimal point in all the numbers.

Output

It is when one considers the available output options that you begin to realise that WordPro is getting a tin long in the tooth. WordPro assumes that you have either a Commodore printer or one of the standard low-quality printers (such as Spinwriter, Diablo or Qume).

This means it can't take advantage of the new range of dot-matrix printers that are currently flooding the market. The manual even states that 'Bold face printing is available on most letter quality printers and is not available on dot matrix printers'. Where have they been hiding for the past couple of years?

You're also limited to connecting the printer to the serial port through a suitable interface. The lack of a parallel connection through the User port is really quite mean - most of the other WP programs for the 64 recognise that parallel Centronics-style printers exist.

One saving grace is that you can send ASCII codes to the printer from within the document; this means that you can use some of the facilities of a modern dot-matrix printer after all, even if it's a trifle laborious.

These codes are obtained in very much the same way as in Visiwrite and work just as well. You can even reassign a different value to the same key later on in the document to extend the range of commands available.

There are also little gems in the commands which enable you to keep a tight control on the printing. The 'forced space' is a space which will be treated as a valid character so that the two words it separates will not be split over two lines - a kind of reverse hyphen.

Likewise the ability to set the line spacing on the output, very useful for creating draft documents and then changing only one format command to print a fair copy.

Other facilities

The writers of WordPro have made a stab at using the colour facilities of the 64. Using CTRL in conjunction with the function keys enables you to change the text, background and border colours. Unfortunately they didn't go nearly far enough in the way they did it. It increases the text colour value by one, it decreases it. 0-4 and 0-6 do the same for screen and border colours.

The big problem is that after pressing CONTROL you can only press the keys once; to step through the range of colours means pressing CONTROL and the function keys alternately. Heaven help you if you get confused while on an unreadable colour combination! Stepping backwards through the sequence is even worse, because you have to use the SHIFT key as well.

Why they couldn't have left CONTROL mode on until you finished changing the colours is beyond me, since they quite happily do it for other commands. And after all that you can't even save the colour combination when you save the file. There is a program included with the manual which enables you to permanently change the start-up colours; perhaps that's the easiest way!

WordPro allows full disk commands to be used following CONTROL ' with the error channel being read by CONTROL '. File commands are accessed by pressing SHIFT CLR/HOME, whereupon you are prompted to Recall, Memorise or Insert; pressing the appropriate first letter of the command then prompts you for the file name.

A plus point is the 'Extra Text' area, it's almost like having a second word processor running at the same time since you use swap back and forth between the two areas using CONTROL 'x'.

Its main use is for common paragraphs and mail-merge data; common paragraphs can be loaded straight into the extra text area from disk and are all named. To use a paragraph from that area you position the cursor in the main document where you wish the insert to take place, CONTROL 'x' then prompts you for the paragraph name.

As soon as you have typed it and pressed RETURN the paragraph is inserted into the appropriate slot. You can give the paragraphs meaningful names such as 'legal for the threatening letter', 'apologies for the 'we lost your order' note, and so on.

There is a useful column addition/subtraction facility. While not as sophisticated as the equivalent in Paperclip, it's better than nothing at all. The limitation is that the result of a calculation can only appear in the same column as the same you are working on.

VIZASTAR 64

THE INFORMATION PROCESSOR

■ Spreadsheet

■ Database

■ Graphics

- One word menu lines for easy selection of facilities
- The high resolution grid pattern frames the worksheet giving an easy-to-read display

- Extract from your information files and include them into the worksheet for fast, powerful calculations and easy reporting
- Instant, on-screen design of your information records

- A 1000 Row by 84 Column wide worksheet with large memory capacity and efficient usage
- Extensive use of Windows allows you to view one part of the worksheet while working on another

- Add or remove items from your records without having to re-construct your existing information records
- Records up to 1,000 characters long with each item up to 250 characters

- Advanced spreadsheet features include individually variable column widths, protected cells, a programming facility plus a wide range of maths functions

- Supports virtually any printer - CBM EPSON JUKI, BROTHER OLIVETTI and many others
- Parallel printers require ONLY a low-cost cable

- Include information directly into the Worksheet from VisaWrite and almost any other system
- Simultaneous display of worksheet and line or bar graphs

- Worksheet manipulation lets you Search, Sort, Copy, Move, Delete and Insert by row, column or a range
- Text editing facilities for letters, invoices, report headings etc

VizaStar integrates three important electronic aids to your business or home office.

A fast and easy-to-use package - VizaStar is a comprehensive information processor that includes an electronic worksheet, information filing system and simultaneous on-screen graphics.

VizaStar has been designed to incorporate the very latest in user-friendliness - so now you can handle your all-important information in many new ways and in a quick and effective manner.

The information filing capabilities of VizaStar enable you to store your information onto disk in

an ordered and instantly retrievable form. This means that you can quickly pick out individual or entire groups of related information to create lists, statements, labels or reports.

VizaStar is the ONLY program of its kind on the Commodore 64. Completely consistent with the VisaWrite word processor, VizaStar provides a totally comprehensive office system.

VizaStar costs just £99.95 (incl. VAT) from your computer dealer and selected stores. Please write for more details and the name and address of your nearest dealer.

WORDPRO 3 PLUS/64 commands

Control Functions

(All preceded by either the CTRL or CMB key)

a	Append lines from 'extra text' area
b	Print a variable block on screen
c	Clear tab
d	Delete words or sentences
e	Erase mode (a=all, r=remainder, l=line)
f	Find a given string
g	Go to a specified line number
h	Hunt (restart a local find function)
i	Fill in variable blocks in text
k	Clear all tabs
l	Copy specified lines
m	Modify search - replace strings
n	Numeric mode
o	Output text
SHIFT O	Exit to Basic
r	Set range (for block functions)
s	Set tab
t	Transfer previously set range of lines
u	Append groups of characters
v	Toggle between main text area and 'extra text' area
w	Enter delimiter for LIST area
x	Global copy (for linked files)
y	Send disk command
z	Read disk error channel
;	Enter a special character
~	Underline on
^	Underline off
_	Bold type on
`	Bold type off
-	Enter hyphen symbol
=	Find variable block
HOME	Delete a variable block
RUN	Clear data pointer to home position
0	Restart program (shifted RUN/STOP)
1	Read directory
2	Superscript
3	Subscript
CRSR RT	Restart global find function
@	Search and replace (l=locally, g=globally)
=	Column add/subtract
/	Format check mark
DEL	Delete one line
INS	Insert one line
SHIFT CTRL	Toggles Insert Mode

Formatting Commands

cm	Comment
cn	Centering (l=on, 0=off)
fa	Form advance
fp	Forced paging
ft	Create page footer
hd	Create page header
hl	Head left margin
hr	Head right margin
je	Justification (l=on, 0=off)
lf	Send line feed to printer (l=on, 0=off)
lm	Left margin
ln	Specified number of line feeds
ma	Margin release
nx	Link next file
p#	Set page number
ps	Set paging
pp	Set page length
pr	Pause
pt	Set pitch
ra	Right alignment
sp	Set line spacing
vp	Vertical positioning

The manual

This is a real gem for the beginner. It is laid out in a very logical order as a series of Lessons and Exercises, starting with 'connecting the equipment' and working up through simple commands to the more advanced features. It assumed you know absolutely nothing about computers, let alone word processing, and this is definitely preferable to the alternative.

There are comprehensive summaries of all the commands and functions plus a useful index. There is also a glossary of terms to explain the 'jargon' words that appear in the manual, a nice touch, and one which more nappers should copy.

Limitations

I was surprised to find that reading the disk directory destroys the text memory in this day and age, and for the price, that seems completely illogical. True, you can read the directory into the 'extra text' area - but it overwrites anything you have there too. To have to save the text to disk before you can read the directory surely defeats some of the reasons for wanting to read the thing in the first place!

WordPro 3 also has a few less than friendly traits; two in particular that caused me problems. The first is inadvertently pressing RETURN while in 'insert' mode, which has the effect of deleting the remainder of the line.

The second is the 'erase' function. Despite what the manual says, you cannot escape from it if it's been selected in error. Unless you are very clever something is going to disappear! This is a pity when other considerations make WordPro a good package for beginners.

Conclusions

WordPro has been around for a long time, which as far as this reviewer is concerned is both a strength and a weakness. A strength, because there are lots of people who know it and will want to stick with it. A weakness, because the suppliers don't seem to have taken the opportunity to bring it up to date and make it the first class package for both beginners and experts it could as easily have been.

I have mixed feelings about WordPro 3. The manual makes it an ideal package for the beginner, yet the limitations and outdated practices make it anything but user-friendly. At £92 I really cannot say it's good value for money.

FOR

- Good range of editing commands including block edits
- Column addition/subtraction
- Good range of disk commands
- Excellent manual for beginners
- 'Extra text' work area
- Excellent document assembly and mail-merge facilities
- Compatible with other versions of WordPro 3

AGAINST

- Text does not appear on screen as it will be printed
- Screen is cluttered by embedded formatting commands
- Directory overwrites text
- Limited range of printers and no connection through User port
- Price

Commodore 64 Video:

The story so far: we're touring the 6566 chip, which gives the Commodore 64 its video. We have noted that the chip goes to memory for its video information, but can only reach 16K; the computer controls which 16K bank via control lines in 58576 (hex DD00). Then we looked through the functions of the video control words - sprite and non-sprite - at 53248 to 53286 (hex DD00 to DD06).

We've examined all the bits in the video chip control registers. Now we'll ease back, and look at the 64's video structure. We'll talk about program design considerations.

In part I we discussed how the video chip gets its screen information directly from memory. We indicated that the chip must dig out all of its information from a single 16K slice. We might draw this as a diagram:

The video chip obtains screen information from one of the four "slices", two slices contain the ROM character generator

We can control which slice we want by manipulating the two low bits in address 56576 (hex DD00). Normally, the processor picks the slice from 0 to 16383.

Once we've picked a 16K block, we must get all screen data from that block - the 'screen memory', the character set, and the sprites. We cannot get the screen data from one block, the character base from another, and sprites from still another, because we are restricted, we must do a little planning and design our video information into our program.

After we have picked the 16K slice, we must set the video matrix (screen memory) to some point within it. We may pick any multiple of 1024 as a starting address. The normal 64 configuration is set to a value of 1, meaning we take the screen information from memory starting at address 1024. The video matrix, you may remember, is stored in the high nybble (that means multiple of 16) of 53272 (hex DD05).

We must pick our character base next. If we're in normal

resolution, we may pick an even multiple of 1024 as a starting address: 0, 2048, 4096, etc. If we're in high-resolution mode we must pick only values of zero and eight, meaning that the hi-res starting address will be either 0 or 8192.

The normal 64 configuration is set to 4 or 8 for either graphics or text mode, meaning we take our character set from: 4096 or 8144. You probably remember that the character base is stored in the low nybble of 53272.

So we'd expect a normal 64 to place into address 53272 a video matrix of 1, times 16, plus a character base of 4 or 8, yielding a total of 20 or 22. (You may in fact see 21 or 23 if you PEEK the location, but the extra bit doesn't matter - it's not used.) And if we switch to high-resolution without changing anything else, our character base of 4 or 8 will be trimmed back to zero...

explaining why we saw zero page when we tried POKE 53265.48 in part I of this series.

Let's try a few specific design jobs.

Task 1: Simple graphics

We're quite satisfied with the screen and character set, but we'd like to add a few sprites to liven things up. First, the normal 64 configuration leaves room for about four sprite drawings (numbers 11, 13, 14, and 15) provided we don't need to use cassette tape during the program run. This may be enough for a lot of animation, all eight sprites could use a single drawing, if that suited the task.

If we needed more than four drawings, we might be tempted to move the start-of-Basic pointer to a higher location, making room for the extras. That can work quite well, but it will probably call for two programs: a configuring program and a final program... It's hard for a program to reconfigure itself and survive.

Task 2: New character sets

If we wish to use the regular character set as well as new ones that we might devise, we'll want to stay in the memory blocks from 0 to 16383 or 32768 to 49151 (these two blocks contain the ROM character generator at offset 4096 to 8191).

If we don't need regular characters at all - we intend to use our own - it may be more convenient to switch to either of the other two blocks: 16384 to 32767 or 49152 to 65535. Since there's nothing but RAM in these two, we may find more room.

Note that some of these RAM addresses are 'hidden' beneath ROMs - Basic from 40960 to 49151, and the Kernal from 57344 to 65536. The video chip sees only the RAM - but in a normally configured 64 system, programs will see only the ROM. You can POKE or store to the RAM beneath, but when you PEEK or load from these addresses you'll get the ROM.

That's OK, the video chip sees the RAM locations you have POKE'd. Result: something for nothing! You can build a character base into RAM - and lose any memory from your system.

Task 3: Emulating a Pet

This is a clear-cut job. We want to move the screen to the same place that the Pet uses the screen. That's a very straightforward from a video chip standpoint. (Note if you type the following POKEs in one at a time, you may have to type blind for some of them.)

The Pet screen belongs at 53768, so we must select the slice with...

POKE 56576.5

... so that we'll pick up RAM starting at 32768. The ROM character generator is still in place.

Since we want the screen (video matrix) to be positioned right at the start of the block, we must set it to a value of 0. The character base can stay at its value of 4 (for graphics mode), so we must set up address 53272 with zero times sixteen plus 4.

POKE 53272.4

That completes the video, but we have a few other things to do to make Basic work in a sound manner. We must tell Basic where the new screen is located.

POKE 448.128

And finally, we should set the start and end of Basic to correspond with a 32K Pet:

POKE 1024.0, POKE 44.4, POKE 64.128-NEW

Clear the screen and the job's done. Zero page usage is still different, so not all PEEKs and POKEs will automatically work on this reconfigured system - but Basic and screen now match the Pet.

Task 4: High resolution plotting

There are only eight places in memory that we can place a high-resolution screen, 0, 8192, 16384, 24576, 32768, 40960, 49152, and 57344.

We tend to choose the two 16K blocks this don't have the character generator, 16384 to 32767 and 49152 to 65535. That way, we'll have more clear RAM to use, there will be more space left for our video matrix and any sprites we need.

If we want to write characters on the hi-res screen, we'll have to generate them ourselves or read them from the character generator. Here's as odd thing: the video chip sees the character ROM at two different addresses - but the processor chip (and the includes your program) sees the same 4K ROM only at a third location, 53248 to 57343. Most of the time the processor can't see the ROM anyway, since the addresses are overlaid with the IO chips.

So if our program wants to see the character set, it must flip away the IO chip with POKE 1.81 - stop.

Part 4: Video structure and program design

by
Jim Butterfield

		IRQ enable			Light Pen	Collision	Sprite	Rastr	53274

Colour Registers

D020	Exterior	53280
D021	Background no. 0	53281
D022	Background no. 1	53282
D023	Background no. 2	53283
D024	Background no. 3	53284
D025	Sprite Multicolour no. 0	53285
D026	Sprite Multicolour no. 1	53286

don't do it yet! There are two problems

First, once the I/O chips are needed out - sound, video, interface, everything - you won't be able to type on the keyboard, so you'll never be able to type the POKE to put everything back.

Second, the interrupt program sets these I/O chips for quite a few things and it will go berserk the moment you take them out of action. So we must use a program or a multiple direct command to do the job, and we must temporarily lock out the interrupt activity. Type the following statements as a single line.

```
POKE 54332,127: lock out the interrupt
POKE 1,51: flip out I/O
X=PEEK(53256): read part of character
POKE 1,55: restore I/O
POKE 54332,128: restore interrupt
```

It will contain the top row of pixels for the letter 'A'. If you liked, you could draw a character's shape with the following program.

```
100 INPUT "CHARACTER NUMBER":A
110 IF A=0 OR A>265 THEN STOP
```

```
120 B=53248+(8-A)
130 C=56333
140 FOR J=0 TO 7
150 POKE C,127:POKE 1,51:X=PEEK(53256)+J*128
160 POKE 1,55:POKE C,128
170 FOR X=1 TO 8
180 X=X-(X-X)*2
190 PRINT CHR$(32+(X-A)*3);
200 NEXT X:PRINT
210 NEXT J
220 GOTO 180
```

To terminate this program, enter a number over 265. You'll note that most of the characters are drawn with 'double width' lines. A video technician would tell you that this reduces the video frequencies and is likely to cause less picture smear.

Summary

Arranging the video areas is almost an art. It takes a little practice, but you'll get the knack of it fairly quickly.

In our next section, we'll give a simple example of a program using sprites. In this way, we'll try to draw together some of the skills discussed so far in this series.

COMMODORE 64 ARCHITECTURE

Mix 'n' Match

Whitby's extra Basic

Whitby Computers Ltd. (who reside in Whitby, believe it or not) produces a number of useful add-on products for Commodore computers to give us poor programmers extra commands to play with. This month we are reviewing a cartridge called the Softchip 64.

It is aimed at people writing business packages, but the new commands and functions on it will be of use to any kind of programmer who feels restricted by the Commodore Basic (and who doesn't?) Most of them can be used either in direct mode or in program mode; and where there are restrictions (you cannot delete program lines in program mode, for example), these are not really too restrictive at all.

The really interesting thing is that there is a wide range of extra commands from which you 'pick 'n' mix' the ones you want. In this article we have reviewed one of Whitby's prepackaged cartridges of commands, but you are quite able to replace any of these which you think are not very useful and replace them with others. A full list is available from Whitby Computers. As every programmer has his own opinion as to what constitutes an ideal set of commands, this seems a very good way of pleasing as many people as possible, especially as the price is the same whether you have the standard article or a custom-built one.

How does this work? Simple - Whitby gives you a list of the commands it can do, and against each of them is noted the number of bytes the new command takes up. Then you just fill in an order form with the name of the command and the number of bytes, and your selections have to make a total of around 7,100 bytes. You can get a lot of commands in that space.

When Whitby gave us the prepackaged 'Business Commands' cartridge, it was described as being for 'the fella (sic) writing £30 programs for the greenkeeper down the road... it's just our choice of what we think people might want'.

Disk handling

Well, we think it's quite a good choice. The first group of statements simply implement the extra statements available in Basic 4.0 as 'Disk Basic', which replace the cumbersome old disk-handling commands with more easily-understood ones. For example, instead of **OPEN 1,8,15, "SO-TEMPFILE"**, with the Whitby cartridge installed we can use **SCRATCH "TEMPFILE"** or even **5 "TEMPFILE"**.

As these commands are pretty well known we will not discuss them any further. But they are useful.

Other commands

We'll now look at the most important of the other commands, passing comments on them as we go along.

BLANK CIF

Takes a string to see if it is null or all spaces. This statement, together with **THEN**, **CEND**, **ELIF** and **ELSE** provide a very powerful structured form of the **IF...THEN** statement. Apart from having an **ELSE** option, it differs from the normal Basic **IF...THEN** statement in that the action (the bit after the **THEN**) can be more than one line long.

DELETE DATIN

Removes a range of program lines. This statement allows the foolproof entry of dates, with automatic checking for the number of days in each month even allowing for leap years. The date format is 14-01-84 for 14th January 1984.

DERROR

Reads the disk error channel. This saves writing a subroutine using **INPUT#**.

DREAD

This statement is not as terrifying as it sounds! If you use **INPUT#**, you will know that it gets confused by commas and colons in the input string. In addition, you are limited to a string of less than 80 characters

ERROR

(not 88 as the **SOFTCHIP** manual says - one of its few errors). By using it on a file opened to the keyboard (**OPEN 1,0**) you can avoid all the "EXTRA IGNORED" problems. It should also work on cassette files.

Wouldn't it be nice if you could trap **DIVIDE BY ZERO** and **BAD SUBSCRIPT ERROR**?

Well now you can! After executing the **ERROR** statement, any errors do not cause the program to stop, but instead to go to the line number specified in the **ERROR** statement, where you can deal with them at your leisure. The **SOFTCHIP** sets a code in a variable **ER** to tell you which error has occurred. Unfortunately it does not tell you which line the error occurred in, which is a severe handicap. It also does not trap errors involved with the **INPUT** statement, or, surprisingly, errors generated by **SOFTCHIP**'s own commands.

GENIN

Like **DATIN**, this replaces the **INPUT** statement. It allows you to specify the maximum length of the string to be entered, and also to restrict the characters allowed.

LWIND/SWIND

These two statements together allow a complete screen display to be stored on the disk and later reloaded. Both the text and colour information is saved, so you can save memory by not having vast amounts of program dedicated to setting up screen displays.

NUMIN

This is another of the very useful "foolproof input" statements, this time dedicated to numeric input. It is intended to be used for inputting money values, so it is restricted to 2 decimal places. It would be nice to have an option to use a different number of decimal places so that scientific or engineering users could input real values with it.

ON

This is an extension of the normal **ON...GOTO** statement. If you say **ON "AEG1" GOTO 100,200,300,400**, the **SOFTCHIP** will carry out a **GET** statement, and if the key pressed was A, E, G, or I it will jump to 100, 200, 300 or 400 respectively. Any other key causes the program to continue at the next statement, in the same way as the normal **ON...GOTO** statement carries on if the

ic commands review

by Chris Preston

PADS variable is out of range. Very handy for accepting single key commands this is Pads a string to a specified length with spaces

CTRL Allows you to change the character sent to the printer, so that all "E" signs (ASCII code 36) are printed as "@" (which prints a pound sign on some printers and has an ASCII code of 35). The trouble is you may have to write some code in assembly language. This works in exactly the same way as the Commodore PRINT # except that you can use TAB without any of the normal problems.

PRINT#

SCOPY Copies the screen to the printer. Graphics characters are replaced by spaces

POP Removes a subroutine return address from the stack so that you can leave it without doing a RETURN. This is often done if the subroutine detects an error, but you can run into OUT OF MEMORY errors if you are not careful. Basically, this command cancels out the last GOSUB statement.

PUSH Allows you to insert a false RETURN address on the stack to fool Basic into thinking you have done a GOSUB from that line. In effect, this gives you a 'calculated GOTO', so that you can say GOTO X where X is the variable. This is not the place to discuss the point, but many experienced programmers decry the calculated GOTO statement. Not a command we would fall over ourselves to use.

PRINT@ This statement allows you to justify all your money figures, so that the decimal points in a column of figures all line up

RESTORE The normal Basic RESTORE statement moves the DATA pointer back to the start of the program. With the new statement you can move the pointer to any Line number. This feature is a cross between a user-defined function (DEF FN) and a subroutine. ROUT defines a subroutine (which the manual misleadingly calls a function) which is called by PER. Like the Basic user-defined function, you can specify arguments which are then used in the subroutine. The advantage is that you can write a generalised subroutine called OP which uses a dummy variable X, say, and then by giving it different arguments call it by PER OP (A) or PER (OP3: B+12). In normal Basic you would have to say X=A:GOSUB 13000 and X=3*B+12:GOSUB 13000. As you can have as many arguments as you want this represents a much more efficient way of coding this sort of problem. You can also have string arguments

SCAN Scans a string for a substring. You can search a string for space, for instance, or a "D" or "LEAD". During matching, the difference between capital and small letters is ignored, so "s" matches "S".

SORT

Sorts a one-dimensional array, which can be numeric or string. It can also perform a tag sort, so if you have two arrays, one a list of persons' names and the other their ages, the second array will be sorted in the same way as the first, so that a person's age is still in the element corresponding to his name. This is extremely useful in many applications

SPCS Gives a string of a specified length consisting of spaces. No longer will I have to set up a string SP\$ of 80 spaces and then use LEFT\$(SP\$,Z)

SWAP Allows you to chain from one program to another without losing all your variables.

Data entry

There are three 'data input' routines: **DATIN**, **GENIN** and **NUMIN**, for input of dates, numbers and general strings. When the operator has entered the string a variable ek contains the value of the key used to leave the field, which can be RETURN, CURSOR UP, CURSOR DOWN or STOP. This is invaluable in building up a proper data entry system, as with a bit of programming a screen full of data from a number of fields can easily be input.

Using Softchip

The cartridge plugs into the port in the usual way. When you turn on the 64 you get a message on the screen to remind you that you now have a super Basic language - and also that the **SOFTCHIP** has gobbled 8K of memory, leaving you with 30717. This is not as bad as it sounds, because using the cartridge's routines will save you memory by making a lot of your Basic subroutines redundant.

The manual is well-produced and properly typeset, with only the occasional grammatical and spelling errors. It's laid out with one command to each page, and obviously has to be tailored to match the commands selected by the user. Whitby has not been afraid to add a page of corrigenda at the back, which is good to see. Too many manufacturers try to hide their mistakes and cause their customers no end of trouble trying to find out why they can't get the product to work.

In summary, this seems to be an extremely useful device. Many people will buy the standard cartridge at first, but you can go back to Whitby Computers for an expansion package to add more commands. Definitely worth the money if you write a lot of data processing programs.

Opening up spreadsheets

Business ifs and whats for the 64

by Ken Ryder

As their prices have tumbled to match the times they're run on, and additional facilities have been added—multiple linked pages in many multiple windows on screen,

data can be carried over from one sheet to another in that sort of thing—so that along with the desktop munchie-gobbling game, the word processing package and the database the spreadsheet has become part of the micro owner's library of almost every micro owner. Spreadsheets are now available for less than

£30, the original user base of businessmen who wanted to check out the effects of changes like increased profit margins on their cash flow has been supplemented by an entirely new breed of users who employ them for personal accounts, appointment books, even a primitive kind of word processor.

This month, KEN RYDER looks at two spreadsheets under £100 and considers that the cheaper is actually the best value.

Virtually all spreadsheets have the following characteristics in common (stop as if you've heard it):

- the sheet itself occupies a "virtual screen" several times the size of your normal screen display, and as you move across, or up, or down, the display scrolls past the screen window;
- data is input into single squares of the sheet, known as cells, in the form of text (LABELS), figures (VALUES), or FORMULAE, consisting of calculations performed on preceding values;
- this means that if you input the figure 100 in cell A1 and the figure 200 in A2, then if A3 contains the formula A1 + A2 it will display the figure 300;
- the "what if?" facility means that it can recalculate instantly, or that if you change the contents of cell A1 to 200, the contents of A3 will change to 400 (often it is possible—and advisable—to switch off this recalculation feature while inputting large masses of data, since it can slow matters down rather);
- labels, values or formulae, or columns or rows of any or all three of these, can be replicated, or copied, to other parts of the sheet, simplifying the setting up of a sheet structure before you input any data;
- during replication, formulae can be copied with absolute or relative values, so that if A3 is replicated to C3, either the absolute values of the formula A1 + A2 can be retained, or changed to the relative values of C1 + C2;
- cell contents can be formatted in various ways: labels can range left or range right, values or results of formulae can be displayed as integers, floating point, or pre-determined numbers of decimals (usually two, for the representation of decimal currency like dollars and cents, or pounds and pence), with or without rounding;
- formatting can be confined to individual cells, replicated to specific areas of the sheet, or applied globally to the entire sheet (though individual exceptions to the global format may be specified);
- data can sometimes be interchanged with other programs (often in Basic), but this often involves a rather complex routine known as Data Interchange Format (DIF) which is particularly useful for swapping data (but not formulae) between different spreadsheets eg, Visicalc and CalcRemit;
- some spreadsheets can load Visicalc files and modify them as if they were "native" files, which is useful for people who started with Visicalc but have swapped to a rival spreadsheet because of extra facilities it offers.

Abracalc

Abracalc market several games educational and business packages for Vics and 64s. They have now added a spreadsheet to their list, available on disk and cassette for £27.50 plus £2. The disk version is presented in a good quality plastic binder for safe storage of the disk and documentation.

The software is written in Basic and occupies about 32.5K, taking about 90 secs to load on disk but representing an 18-minute load on tape (yawn). After running, about 5K is available for the contents of the sheet.

This is a small spreadsheet consisting of 26 (a-z) columns and 40 rows. Usually four columns and 11 rows are displayed with the bottom half of the screen devoted to a "HELP" menu (figure 1). This is useful while learning to use the sheet but you can dispense with it subsequently, so that you can view up to 20 rows at any one time or any one time.

Alternatively the screen may be split across the width row and 8 columns of a different part of the sheet can be compared with the top half. The bottom half of the screen cannot be edited, but the values displayed change if affected by a recalculation.

Abracalc Commands

Command	Title
/a	Autolock switch
/b	Blank current cell
/c	Clear
/d	Delete
/f	Free memory
/g	Graph
/i	Insert
/j	Justify
/l	Line
/p	Print
/q	Quit
/r	Replicate
/s	Storage
/v	Version
/w	Window size
/x	Unsplit screen
/z	Split screen
Home KEY	Home the cursor
shift ok KEYs	Cursor to spreadsheet and
shift return KEYs	Cell display switch
/1 KEY	Change border colour
/2 KEY	Change screen colour
/3 KEY	Formula protect
- KEY	Cursor to left of row
= KEY	Cursor to top of column
/C KEY	Recalculate
/G KEY	Goto a cell

Abracalc Functions

Function	Description
SUM	Adds the cells in a row or column
AVE	Calculates the average of the cells in a row or column
MIN	Finds the minimum value in a row or column
MAX	Finds the maximum value in a row or column
COUNT	Calculates the number of non-blank entries in a row or column. This information can be used to find the number of values in a row which can then be used in further calculations

The layout of the sheet is fairly standard with three control lines at the top containing a cursor which flickers at an annoying rate. The cursor is controlled with the normal Commodore keys although the response is rather slow and jerky. The HOME key returns the cursor to the top left hand corner of the sheet and SHIFT/HOME takes it to the bottom right. In addition the left and up arrow keys rapidly take the cursor to the leftmost column or topmost row respectively. The relatively slow action of the cursor control keys is compensated by a fast GOTO option.

The column width is nine characters and cannot be altered. Long labels are possible by typing continuously; as one field is filled, the characters automatically spill into the next. By default numbers are displayed to two significant

figures, and stored and manipulated to nine figures. Only integer or decimal numbers may be input, exponential format is not accepted.

Formulas are rather limited as only two cells, or one cell and a value may be included. Even then they may only be added, subtracted, divided or multiplied, i.e. SIN, COS, LOG etc., are not available. The spreadsheet does offer five special function formulas - SUM, AVE, MIN, MAX and COUNT, (table 1) - but they only operate on rows or columns, not matrices. There are no conditional operators, so IF THEN calculations cannot be performed.

Replication is limited to individual cells and is absolute, except for the above special functions which may be copied relatively. The contents of individual cells may be cleared, and there is an option to blank all the cells of a specific generic

type i.e. labels, values or formula. This is useful for creating standard framework sheets.

The contents of a cell cannot be edited. The whole cell must be overwritten just to change one character; this isn't a great disadvantage as a cell may only contain nine characters maximum.

The JUSTIFY command is a little misleading as all it really does is to set the format of numeric values allowing them to be displayed as integer, real or 'scientific'. It has nothing to do with the justification of text.

Output

Of course the spreadsheet can be saved and loaded to tape and disk, but the LOAD option has an additional facility: once a sheet has been loaded a second may replace it or be added to the values of the first sheet. Labels and formulas are ignored. Thus individual weekly sheets may be consolidated into monthly, monthly into quarterly and so on, a very useful facility sadly lacking on some more advanced spreadsheets.

The contents of the sheet may also be output to a Commodore 1616, 1626, 1630, 1636 or equivalent printer together with an optional title up to nine lines long and 30 characters per line. The sheet may be printed with or without grid references.

The data in up to 40 consecutive cells either rows or columns may be displayed graphically as a horizontal bar chart on the screen (figure 2) or output to the printer.

Documentation

Instructions consist of a small thin booklet of 10 pages. The first four pages introduce the spreadsheet and its workings, the remainder is a reference section to all the commands. The information is minimal, just enough to get started.

A little more effort with an example sheet introducing each command in turn would make the whole package more professional.

Conclusions

Abracalc is a relatively small spreadsheet aimed at the home user market. Its limited mathematical functions and lack of conditional operators make it unsuitable for business purposes but are good enough for the more mundane household accounts. The graphs produced from the sheet are excellent allowing data to be displayed in an easily digestible form. Unfortunately the whole product is undermined by poor documentation.

Price: £27.50 disk, £25.00 cassette.

Basicalc

Supersoft, a well known purveyors of Vtc and 64 software, has introduced two spreadsheets to its range, BASICCALC 1 and 2, and they will shortly be introducing a third. However, Basiccalc 2 is at the moment the more powerful version until the semi-3D Basiccalc 3 comes along. The software requires a three part load taking about 90 seconds, and produces a 9.5K sheet.

Unlike many other spreadsheets Basiccalc 2 does not have a fixed size. The user defines enough rows and columns to suit the application: the number of rows must be in the range 30 and 256, the number of columns between 10 and 128 and the product of the number of rows and columns must not exceed 23,500 cells.

As there is only a 5K of memory for the sheet you will run out of memory before you can fill up all the cells.

There is also a FIND command which will hunt for any string of characters, useful for locating

Review

Up to five different areas of the sheet can be viewed on the screen at once. The column and row headings may be fixed across the top and left hand side of the screen respectively. In addition the column and row totals may be fixed across the bottom and right hand side of the screen. The remainder of the sheet may be scrolled and edited within this 'framed' area.

Complex formulae containing up to 36 characters, including up to 20 levels of parentheses can be used, so can the standard Commodore 64 maths functions.

Formula entry does not follow the normal mathematical hierarchy found in Basic. Instead it uses Reverse Polish notation commonly used in calculators, and the language Forth.

For example, Basicalc evaluates the formula:

$+a3+20^2$

as

$+(a3+20)^2$,

not

$+a3+(20^2)$

as you would expect from normal mathematical hierarchy.

There are several special functions - SUM, AVE etc. (table

1) - all of which can operate on rows, columns or matrices, i.e. a rectangular area of cells. The results of individual formulae can be rounded from 0 to 6 decimal places of accuracy by appending a rounding command to the formula.

This not a formatting command, once you've used this option the values held by Basicalc are stored as the rounded value, so you must be careful not to accumulate significant rounding errors.

Three user-definable functions, W, X and Y can be used to contain common formulae. The concept is similar to the DEF FN command in Basic except that up to 10 parameters may be included in the function.

The values of the parameters are specified when the function is called within a cell. For example V(1) indicates a parameter, eg the price of an item excluding the dreaded VAT. If we want the total price of the item including VAT the function W could be used to specify $V(1)*(V(1)^{15/100})$.

Every time such a calculation is required only the function W

need be given together with the value of the parameter, eg $+W(1)$.

If several parameters are used they are separated by colons, eg $+X(a3:10:c4)$.

Short text strings may be appended to a formula giving the output some units i.e. %, mpg, ft, mm etc. making values more understandable.

Sheets may be colour-coded, eg red for one department, green for another. The F2 key selects one of the seven screen/border colour combinations available.

Output

All or any rectangular part of the sheet may be saved to tape or disk by specifying the top right and bottom left cell co-ordinates.

A hard copy of any part of the sheet may be sent to the printer connected to the serial Port or a Centronics compatible parallel printer connected to the User Port. Each individual printed column width may be different from the screen set width, and commas may be included in large numbers to make them more readable i.e. 15,547.04 - a very unusual feature.

Documentation

The documentation is an impressive 41-page typeset book. Basicalc is introduced, a brief example is given and all the commands are described in detail. The appendices include a summary of the commands, a comprehensive home expenses sheet to enter, and advanced lessons on user-defined functions, and formulae.

As the data created by the sheet may be needed by other programs the data storage format used is given, together with an example program to load a Basicalc file into a Basic array.

Conclusions

Basicalc offers a very flexible format enabling large or small sheets to be created, tailored to particular applications.

Unfortunately the Reverse Polish notation deviates from normal mathematics and familiar Basic hierarchy, requiring a period of familiarisation for those used to it.

The lack of any graphics output is a serious failing, as it is often far easier to interpret graphical information than rows

I Wish I could get my 64 to do something clever...

What a
Good idea!

SIMPLY RIGHT SIMPLY WRITE

BUSINESS QUALITY PROGRAMS HOME COMPUTER COSTS

Simply Write Word Processor

A favourite with PET/IBM users since 1981. Completely rewritten for VIC 20 and 64, with function keys and colour for extra ease. Full screen editing. Keeps and appends standard sections to build contracts, quotations etc. Includes 'mail merge', page headers, page numbers. Links files for long texts. Records character sets, graphics. Works with tape or disk files, any printer. Needs 14K.

£35 + VAT tape, £40 + VAT disk (PET £5 + VAT more)

Simply File Database Management System

Full function Information Manager. Random access files on any Commodore single or dual disk drive. One of the best available systems on the PET/IBM at any price, and probably the best for 64 and VIC 20. Suitable for stock control, mailing lists, club and school records, VAT input and output records etc. Prints analysed columnar summaries with total and averages. Prints mail labels. Calculates. Creates sequential files to work with other programs (including 'Simply Write'). Even includes provision to add your own routine in the unlikely event it doesn't do everything you want!

PET/IBM £65 + VAT VIC 20 or 64 £60 + VAT

ULTRABASIC-64

£22.95 tape £24.95 disk

Adds 50 powerful commands to Basic, including hires & multicolour graphics, sprites, turtle graphics, sound joystick, light pen, screen dump to printer & more

CRARTPAK-64

£24.95 disk only

A comprehensive package that gives you professional charts in high resolution graphics with any of 8 different formats. Data can be simply entered, edited, saved and recalled and the final result can be recorded on your printer. Also works with Basicalc hires

SYNTHY-64

£14.95 tape £16.95 disk

The Best music synthesiser available for the CBM-64 now distributed exclusively by Adamsoft. Makes it easy to use the sophisticated sound capabilities of the computer. Sample compositions included.

Also available, a choice of three music disks or cassettes (Classics, American & Christmas) at £8.95 each

ZOOM PASCAL

£29.95 disk only

A powerful subset of PASCAL at a very reasonable price. ZOOM PASCAL runs on a CBM-64 with 1541 disk drive. The package consists of an editor, compiler & translator and sample programs. True machine code is generated so that compiled programs will run independently and at high speed.

STAGSOFT RESET BUTTON

£5.95

Escape from crashes and recover your Basic or machine code program intact. Plugs into serial port at rear of computer or disk drive.

Many more products available for VIC-20 CBM-64 and PET. Adamsoft are UK distributors for all ABACUS SOFTWARE USA products. Send s.a.s for catalogue and details of our discount offers.

BOOK LOOK

The Joy of Computers

The Book:
The Author:
The Publisher:
The Price:
The Reviewer:
The Conclusion:

The Joy of Computers
Peter Laurie
Hutchinson
£9.95
Bohdan Buciek
Beautiful rush-mash

If you're prepared to pay as much as £10 for Peter Laurie's book *The Joy of Computers*, you would rightfully expect it to tell you how to get more pleasure and fulfillment from computing, how to do different and more imaginative things with your domestic bundle of chips. Not so, regrettably - this substantial (and not inexpensive) tome suffers from a badly misconceived title.

The only really practical enlightenment you'll receive comes in Part Two of the book, the section on programming. The uninitiated will find a comprehensible discussion of the basic problems (as it were) involved in organising and structuring programs. There's also an amusing account of a hypothetical program for setting lunch and a progressive discussion of how it can be enhanced and developed - but nothing much for the more experienced.

A few chunks of program are given (illustrating arrays and things) and then a few listings of games (in Basic) you might key in. That's followed by a complete program listing of a game called *Star Voyages* - more than 1000 lines of it. Personally I'd rather run a marathon than key that lot in.

A large proportion of this book is devoted to the now obligatory potted description and history of computing (helps to fill a few pages). Then there's a competent overview of the computer and how it works right down to silicon level.

Peter Laurie certainly knows what he's talking about - in his time he has been one of the more respected computer journalists around. Trouble is, he knows too much, and he can't (or won't) decide what kind of reader he's aiming for. Which gives the whole book a dubious purpose.

So to section three - and that too seems inappropriate for this kind of book. It's a huge and rather plodding account of how computers are used professionally, with little sections on the different aspects of business software. Since when was business computing a joy?

What value there is in this section must be in the range and scope of uses discussed, the accounts are short and sharp. And Laurie doesn't miss anything out, indicating new and vital areas in computing: computer-aided design, networks, robotics, computer speech and vision.

This section is visually very well produced - as is the book generally. There are some really stunning full colour examples of computer graphics (a double page illustration begins each section) and each topic discussed is meticulously illustrated with photos and diagrams. Certainly it's marks there.

The final section, called *Progress*, tries to put all the knowledge you've just assimilated into some kind of historic perspective. Laurie discusses the evolutionary process of computing and attempts to answer a few 'what-ifs' questions.

Could computers become living organisms? Laurie probably worries about that - maybe computers won't provide as with much joy in the future.

Basic Subroutines for Commodore Computers

BOB ADAMS

The Book:
The Author:
The Publisher:
The Price:
The Reviewer:
The Conclusion:

Books which teach people how to program now fill the shelves at most bookshops. But most of these only deal with the theory of programming, providing little in the way of practical guidance.

As a beginner, what you need, once you've mastered the rules of Basic and can string a few lines together in something to teach you how to use your knowledge to write useful and usable programs.

Unfortunately, in those books which do offer sample programs, these programs are often riddled with bugs or misprints. Someone who is just learning to program is not going to be able to find any errors and put them right, and so is faced with the prospect of spending a lot of time keying a program in just to find that it does not work.

Basic Subroutines for Commodore Computers contains a large number of really useful programs. They range from simple conversions (gallons to litres, pounds to tonnes and so on) to business, loans and investments matrix operations, statistics and sorting; they come as 22 chapters arranged in alphabetical order of subject.

Each 'problem' has its own subroutines written to solve it, which allows you easily to incorporate it into your own programs, and there's also a 'menu' which connects all the subroutines on a given topic to form a general program for matrix operations or temperature conversion.

This has an extra advantage that a program can be keyed in and tested one part at a time. That is the essence of 'structured programming', and it means you can get a working program without having to key in hundreds of lines of code, adding to it section by section as time permits.

The programs do not use any advanced statements, *PEEKs* or *POKEs*. That means they're easy to understand but will also run on any Commodore machine without trouble. The only problem will be for people who own *Vic-20s* as the programs are set to give 40 column displays.

Conclusion? The book is just the thing for a beginner in programming. It will show you how to write problem-solving programs while providing the nucleus of a library of useful programs and subroutines. The printing method means that all the programs should work first time, assuming that they have been keyed in correctly.

The 64 ought to be an excellent computer for games – and fortunately some suppliers are indeed taking advantage of that. Others aren't. Here's this month's crop of reviews.

How do we assess games? Basically we play them – which may sound obvious, except that all the reviewers have seen so many games that they can apply a bit of comparative experience to the evaluation.

We rate games out of five for each of four criteria. **Presentation** means how well the thing is packaged and how good it looks on the screen: dull graphics and poor sound get marked down here. **Skill level** refers to how much skill (of whatever kind) is required to play the game – so if pure chance is involved, the game gets a low mark. (But don't dismiss it on that: some 'chance' games are great fun.) **Interest** is an answer to how well the game did at maintaining the reviewer's interest in it. And **Value for Money** is obvious enough: it's our overall conclusion about how it compares with other games and whether we'd buy it ourselves.

EXTERMINATOR

Joystick or Keyboard
Price £4.99

On loading this program I was greeted by a snazzy title screen, replete with flashing lettering, inviting me to proceed. Full of curiosity and ready for another skirmish with the insect world I chanced my arm, immediately I was at combat with a two-tone worm squirming through the fungi forest. I noted a green, spritz-propelled mosquito and a convincing-looking scorpion too, but I was most impressed by the finely detailed eagle which squawked as it dogged my every move. This avian pest was assisted

by a terranula which had to be avoided, being impossible to blast. My initial successes were marked by a change in screen colour, but eventually I succumbed to overwhelming forces.

A well implemented version of Centipede, carefully prepared right down to the title screen and with good use of colour, sound and sprite graphics.

The storyline is obviously popular and this version should certainly add to its admirers. **LS**

Bubble Bus

Presentation: ☒ **Skill level:** ☒
Interest: ☒ **Value for money:** ☒

HUSTLER

Joystick or Keyboard
Price £4.99

A compendium of six pool-style games for one or two players. You

position a plus sign to mark the point of impact, wait for the desired degree of velocity as indicated on the gauge, press the button, and presto – another successful pot.

Obviously some complicated algorithms are employed in this engrossing simulation in order to replicate the interaction of angles, speed transfer of kinetic energy and resultant deflections. Without being really pedantic I can see no room for improvement in either the graphics or sound effects and the routine accompanying the title and menu screens is a positive joy.

You can switch from game to game whilst the top scores for each is retained on the hi score screen. An absorbing program, well worth having. **LS**

Presentation: ☒ **Skill level:** ☒
Interest: ☒ **Value for money:** ☒

MOBY DICK

Joystick only
Price £7.95

A jolly nautical jaunt which I found most intriguing – in fact, far more enjoyable than the scenario suggested. A white ship is petting the sea and by judiciously releasing depth charges, under your adept guidance, the ship is attempting to deplete an inexhaustible supply of submarines. In the first phase (it's too obvious to say 'wave') they'll reply with floating mines and tracking machines.

Meanwhile the itinerant Moby Dick must not be harmed by a

careless salvo, or a green ship will steam in and ram you.

A further complication hovers overhead, dropping bombs. If you hit the helicopter the only decent thing to do is to catch the pilot before he splashes into the drink, scoring extra points into the bargain.

Sound effects are spot on. Well worth adding to your collection – I'd suggest this program will provide hours of fun to most 64 owners as it is not too frantic. Recommended without reservation. **LS**

Presentation: ☒ **Skill level:** ☒
Interest: ☒ **Value for money:** ☒

WORD FEUD

Joystick or keyboard
Price £7.95

At last an education game for youngsters that really can be fun for the family. You're given a word at the top of the screen which is hidden twice amongst a jumble of letters. You have to find that word, using a joystick or keys to position a 'window' around it. You then fire – and if you get it right, lots of little men jump around at the bottom of the screen. A wrong answer or choosing the decoy word (there's only one of those) makes a little man fall down.

But the game has a number of variations, like not displaying the word you're looking for, and bringing in four letter words

(they're all clean). A tougher section is the mixture of three and four-letter words.

Word Feud is also designed for one or two players. Single players can challenge the frog or butterfly which steadily eat the letters whilst you're trying to figure the word out. You lose if they manage to eat both words. For two players, there's two windows and a more competitive edge.

The bundle claims that Word Feud has a 750-word vocabulary, so the game shouldn't become predictable. The letters are large and clear, and the graphics are good (especially the frog). Shame about the incessant pulsing sound – but you can turn that off.

This is a good game for parents and children to play together. Whether it's educational or not is a different matter. It's fun, it's well thought out and has more than one facet. Good use of funnion keys too. **BS**

The best accessory for your micro

ONLY
£34.49
(P+P £2.50)

The Rotronics Portable Case

Here is the ideal portable work station for home, school or work. Specially made for most home microcomputers, it contains your VIC 20 or CBM 64 within a smart executive style case with removable lid for convenience in use.

The individually tailored foam insert securely protects your micro and cassette recorder (both types) during

transit. Additional storage space in the lid holds manuals and up to twenty cassettes. A scalpel is provided to modify the insert for expansion units and an alternative insert can be supplied if you change your hardware in the future. The case is also available with uncut foam inserts.

All components remain fully operational within the case via inter-connections

routed between the double layers of foam, so there are no unsightly leads

This is the first case designed for easy use with each component positioned for convenient operation. The overall dimensions are 138mm x 700mm x 363mm.

VIXEN RAM Cartridge

Versatile unit with switchable memory blocks. Allows standard 16K BASIC memory expansion, or RAM to be relocated for machine code uses. Two VIXENs may be combined (using the Motherboard) and set so as to fully expand the VIC to 32K. £34.45 (p+p 50p)

VIXEN Motherboard

Allows up to four cartridges to share the VIC 20 expansion connector. Switches allow two of these ports to be switched in or out, or to be relocated in memory. The VIXEN also incorporates a socket which accepts software in PROM form: a utility PROM is already available (not supplied) which adds 16 new and useful commands to VIC BASIC. £31.95 (p+p 50p)

THE BIG ONE

Win £1,000 worth of extras
for your Vic or 64!

PART THREE

50
runners-up
prizes

The main prize:

A printer with paper and spare ribbons ... a disk drive with ten disks for it ... a word processing package ... a database package ... a spreadsheet calculator package ... a dustcover for the computer ... a lightpen ... a joystick ... the Programmer's Reference Guide for your computer ... the best of the users' books that have been published independently ... a whole collection of games on cartridge and tapes ... programmer's aids to simplify programming ... colour and graphics editors ... ten blank cassettes ... a Commodore User sweatshirt ... and more!

For the runners up:

- * Five second prizes of a free subscription, a Commodore User tee-shirt, and a Commodore User binder for your magazines
- * Ten Third prizes of Commodore User sweatshirts
- * 35 Fourth prizes of Commodore User tee-shirts

How to enter:

The £1,000 Competition runs in three parts, and you'll need correct answers to all three to stand a chance. You will also need the cut-off coupons from the bottom of the Competition Page: all the entries MUST be accompanied by the coupons from the February and March issues and the Entry Form from this one.

PART THREE: THE £1,000 EVALUATION

The third and final part of our simple (if exhausting)
£1,000 marathon.

- SECTION ONE:** list what you regard as the five best points of the Vic-20.
- SECTION TWO:** do the same for the 64.
- SECTION THREE:** list the five worst points of the Vic.
- SECTION FOUR:** ... and again for the 64.
- LAST-MINUTE EMERGENCY TIE-BREAKER:** tell us a joke about computers (preferably, but not necessarily, featuring a Commodore computer).

Couldn't be simpler, really, could it? Now find your entries to the other two parts, parcel them up with this, include the coupons from February and March, enclose the entry form below, and send it to:

£1,000 COMPETITION
COMMODORE USER
THE METROPOLITAN

DUCKWORTH HOME COMPUTING

All books written by Peter Gerrard, former editor of *Commodore Computing International*, author of two top-selling adventure games for the Commodore 64, or by Kevin Bargin. Both are regular contributors to *Personal Computer News*, *Which Micro?* and *Software Review*.

VIC GAMES by Kevin Bargin

This is a collection of 21 exciting programs specially written for the VIC including *Coll, Snake, An Attack, Draughts, Car Dodge, Tank Battle* and *Minesweeper*. An adventure game is also included as well as a program to enable you to derive your own version of *Basic* by re-defining keywords. Each program is accompanied by notes on its structure to enable you to modify or extend it. £6.95

EXPLORING ADVENTURES ON THE VIC by Peter Gerrard
The complete made-to-measure adventure games playing writing and solving them. Starting with an introduction to adventures and their early history, it takes you gently through the basic programming necessary on the VIC before you can start writing your own games. Inputting of information, room mapping, movement, vocabulary and everything required to write an adventure game are explored in full detail. Then follow a number of adventure scenarios, and finally three complete listings written specially for the VIC. Two of the games listed in this book require 16K expansion and the third requires 32K. The three games are available on one cassette at £7.95 £6.95

Other titles in the series include *The Beginner's Guide to Computers & Computing*, *Spitter & Souse on the 64*, *12 Simple Electronic Projects for the VIC*, *Will You Still Love Me When I'm 64*, *Advanced Basic & Machine Code Programming on the VIC*, *Advanced Basic & Machine Code Programming on the 64*, *Exploring Adventures on the 64*, as well as *Pocket Handbooks for the VIC*, *64 Director*, *Spectrum* and *BBC Model B*. Write in for a descriptive leaflet.

SOPHISTICATED GAMES FOR VIC 20

VIC CRICKET Realistic game of skill and luck with all the major rules of cricket correctly interpreted. Full scorecard, printer and game save facilities. Needs 16K expansion. £5.99*

LEAGUE SOCCER League championship game for 2 to 22 teams/players. Automatic fixtures, full action commentaries, match facts, League tables, results check, postponed games, etc. Non league matches also playable - the VIC will even make the cup draw. Printer and game save. Needs 16K expansion. £5.99*

WHODUNNIT? Twelve guests have gathered for drinks at Murder Manor. However one of them has more than drinks on his mind. Thrilling detective game for 1 to 6 players, with genuinely different murder every time. You can even re-name the suspects! Needs 8K expansion. £4.99*

TOP OF THE POPS Money making game about the music business. Make your own records and see them climb the chart. Printer and game save facilities. Needs 8K expansion. £4.99*

VIC PARTY Contains **MASTERWORD**, **A DAY AT THE RACES**, **GAME X** (Strip Poker), and **CONSEQUENCES**. Four games ranging from the serious to the ridiculous. All good fun - nothing offensive. Needs at least 3K expansion. £5.99*

Available from

Hand-holding for 64 graphics

The graphics are among the most praiseworthy features of the Commodore 64. It added an impressive sprite graphics capability to the Vic's facility with user-defined characters.

Only two cheers for Commodore, though, because neither of them are particularly easy to use in programs. A number of software houses are leaping into the breach with promises of simple graphics in return for only a few pounds of your bottom-drawer money. So it's a big hand for graphics editor packages... or is it? Mike Todd put three of them through their paces.

Many of the commands in SUPERFONT are unnecessarily complicated, often illogical. And things aren't helped by the inadequate notes supplied which fail to refer to some of the commands shown on the screen. Only by experimenting was it possible to determine what some of these did; there are others whose functions are still a mystery.

SUPERFONT is a package that could be handy after some experience, but I found it too cumbersome. A character editor is only going to be used on odd occasions and should therefore be totally self-explanatory and straightforward to use - which SUPERFONT 4.0 most certainly is not. There are better and easier character editors around; and I give this one 3 out of 10.

SPRITE MAKER by English Software

This cassette program for designing and editing your own sprites costs £5.95.

Editing is done on a large 80x10 grid with a normal and double-sized image of the sprite shown on the right of the screen - extremely useful when working in multicolour sprite mode. There are also coloured patches at the bottom showing the selected sprite colours, easily changed using the function keys.

The range of commands available is limited but more than adequate. The current set of sprite definitions can be examined easily; and it is possible to get listings of the sprite data in a form suitable for future inclusion in DATA statements. Sprite definitions

can also be saved to disk or tape, and details of how to load them back again are included in the notes.

When SPRITE MAKER loads a file of sprite data, the whole program is restarted and we have to endure the irritating title page yet again. (Can I please make a plea for software authors to stop being clever and annoying users with pointless animated title pages? They may have a place in games programs, but they are irritating beyond belief in utilities such as these.)

When drawing complicated sprites, the limited range of movement provided by the cursor keys is sometimes

frustrating - especially when you have to type the dot or space and then move the cursor on to the next position each time. This program has one solution to the problem: there are two keyboard areas used for joystick-style cursor movements.

The two 3x3 key blocks with OWE and IOP at the top are used with the SHIFT key pressed, then you can move the cursor, laying down or erasing dots as it goes, according to which of the two groups of keys are used. For instance, keeping SHIFT+E pressed will draw a diagonal line of dots up to the right; SHIFT+K will erase the line of dots in the left.

This is a useful facility marred only by the fact that it takes quite a time for the cursor to move - and it is very easy to accidentally move the cursor too far. Both drawbacks are presumably inevitable because the bulk of the program is in Basic. On the other hand, when changing to a different sprite, the grid is filled almost instantly with the sprite design - which means there must be some machine code in there somewhere.

It is certainly straightforward to use and is worth considering. I give it 7 out of 10.

GRAPHICS EDITOR by Rabbit Software

Pay Rabbit £5.95 and you get this cassette containing a combined sprite and character editing package from a famous name.

On running the program you are asked whether it is sprites or characters you wish to design and whether you wish to retain any which already exist. If you opt not to retain the existing character set, you will be given the existing 64 character set to work on.

The program is simple to use, and a description of how to use sprites or a character set saved to disk or tape is included in the notes that accompany the cassette. (Details on using sprites are limited, however.)

There is a range of commands available to the user, which is good. Some of these are rather unnecessary, though, and I found the response to the keyboard at times frustratingly sluggish when editing sprites.

Under review: Sprite Maker

Description:	Define sprites for the 64
Supplier:	English Software Box 43 Manchester M60 3AD
Summary:	Useful if a bit slow: 7/10
Price:	£5.95

SPRITE MAKER - creating a 'plane. Left hand 'drawing grid with normal and double-size sprites on right (English software)

SOFTWARE 4.0 by English Software

SUPERFONT is a cassette-based program at £6.95 that is intended to allow you to design your own character set or to modify the existing 64 set.

It starts off with an instant title page, totally out of place in staidity of this nature. It goes on to set up the working screen with the usual edit matrix for editing. The rest of the screen shows the range of commands available, the full upper case/lower case character set and other data relating to the program.

All this results in a badly cluttered display - which is at best unnecessary and at worst confusing.

The character set displayed can be flipped between the usual 64 set and the user-defined set, although again there is no provision for getting at the lower case/text character set. There are three modes of operation:

● **EDIT** mode allows you to draw a new character using the cursor controls, the 'Q' key to plot a dot and the back arrow to erase points. You can select

a character from the character set and edit it, or design your own and insert it into the character set.

● **MOVE** mode allows the character in the grid to be scrolled horizontally or vertically using the cursor keys.

● **DRAW** allows the user defined character to be drawn at its proper size within the grid.

Complete character sets can in theory be saved to disk or tape, though I was unable to get the disk option to work at all. The program can load these character sets back again at any time; but to use them in your program will itself require a small program (given in the notes) to read the data back - the data is stored as a sequential file and so cannot be loaded back using the normal BASIC LOAD command.

Under review: Superfont 4.0

The exciting range of COMPUTAPIX PRODUCTS for the VIC 20 and CBM 64

IEEE-488 Cartridge

The Computapix IEEE adds a new dimension to your CBM 64 or VIC 20. IEEE is the fastest and most reliable interface available today. The cartridge works with a massive range of software including: **SDMON'S BASIC**, **WORKSHEET 40**, **VIDASWRITE**, **EASYSCRIPT** and all Commodore Easy programs. IEEE takes you into the world of professional and business computing. Since you have the full power of the IEEE-488 Standard you can access the complete range of thousands of IEEE peripherals and instruments.

The Computapix IEEE has all the IEEE instrumentation commands written in. The IEEE code is fully relocatable within your CBM 64's memory. The IEEE cartridge has a memory expansion slot for use with cartridge software such as **SDMON'S BASIC**, **SUPERAID** and **MAXIMON** etc.

Price £54 Plus V.A.T.
(VIC 20 or CBM 64 version)
Two powerful interfaces for the price of one.

MAXIMON - Machine Code Monitor

The Computapix MAXIMON is a cartridge based machine code monitor for your computer, carefully tailored to your needs. It has over 30 commands many with several options. On the CBM 64 it allows you to use the full 64K of RAM, and automatically handles all input/output of the computer via the use of a pseudo internal.

At last, you can use the full power of the microprocessor to run, store and develop your own programs.

MAXIMON has an immediate Assembler/Disassembler and Printing Disassembler, providing you with hard copy of your important source code, plus many other very powerful and many other useful functions. Full error messages are given when using the cartridge.

MAXIMON will work with and can be called from BASIC programs. All working variables are preserved, and your BASIC program is kept intact when you use it. MAXIMON has been carefully developed by many machine code enthusiasts, and is the most powerful debugging tool available today! **Price £19.95** Plus V.A.T. (VIC 20 or CBM 64 version)

SUPERAID The Professional Programmer's Toolkit for CBM 64 and VIC 20

The Computapix SUPERAID gives you over 30 commands - many with several options, on an easy to insert cartridge. This powerful toolkit allows you to quickly and efficiently write and debug your programs, with the help of the powerful CHANGE command.

Your programs will be easier to enter, debug, alter (with 4 parameter remember command) read and arrange, understand, and more fun to use. The main machine code monitor allows you to save your machine code programs to tape or disk - no more need for BASIC loaders. Soon you will find it hard to imagine a computer that does not have the extra commands the SUPERAID gives you.

SAVE £11.50

Price £19.95 Plus V.A.T. (VIC 20 or CBM 64 version)

NEW! MAXIMON & SUPERAID - all one cartridge!

This revolutionary new cartridge has all the facilities of MAXIMON and SUPERAID, plus full DOS support in the MAXIMON giving you easy access to the contents of your disks.

Price £29.95 Plus V.A.T. (VIC 20 or CBM 64 version)

Lumpsum prices are available by direct mail, complete with 12 months guarantee. Send coupon to: **COMPUTAPIX LTD, FREEPOST** (No stamp required) **LIVERPOOL L35 7XB.**

The Commodore User Profile

Lightning strikes

How do the latest computer games titles get on to your local dealer's shelves? These days, that is done most effectively, and for most games by a distributor – a 'middleman' whose sole job is to take games from the manufacturer and get them to the retail outlets.

Record distributors are already in that kind of business and they've divined that computer games can be handled in precisely the same way as records. Lightning Records and Video found this out a little before the rest of them, and has capitalised on its entrepreneurial piece of foresight. Bohdan Buciak talked to Lightning's Loretta Cohen, a diminutive figure with a somewhat larger job title.

The sharp-eyed face of Ray Laren, Lightning's MD, appears regularly in the video and record trade press amid bad puns about his "thundering" success. His claim to fame is that he started Lightning Records about twelve years ago and managed to fill nearly every jukebox in the country with chart topping hits. That success bought him a large warehouse and suite of offices in dreary West London.

As well as distributing records, Lightning got involved in computer and video games – distributing both the software and the machines themselves. Now, the company has a Commodore dealership too: it distributes more than 7,000 games titles from almost every conceivable software house.

Loretta Cohen has the job of making that side of the business work. She admits to not knowing much about computers, but she does have formidable credentials in retailing. Her parents were video and TV dealers and, before joining Lightning, she ran a small chain of computer shops. Her son now manages that (working for Lightning gives her little time for other activities). With that kind of background, she must know better than most what a dealer requires from a distributor – and what kind of service a good distributor should offer.

"Distributing software is no different to records and films in the sense of getting products around to dealers. But software needs more specialised looking after. Records can be easily heard, films get their reputation from being seen at the cinema. Software must be promoted."

Taking stock

Today's software distributor is far removed from the traditional

wholesaler of tea, bricks or nougat bars, who merely takes orders and delivers the goods. Lightning sends a monthly catalogue to all its dealers which sets out items available, prices and everything else they need to know – Ray Laren likes to call it "the Bible of the computer industry". It may not be revered quite that much, and unlike the Bible, it is updated regularly.

That catalogue probably wouldn't be possible without Lightning's very own computer. Loretta Cohen sees it as the most important factor in her operation. Lightning's ten 'telesales' girls type dealer orders directly in to the computer, which prints out a hard-copy down in the despatch department. It even lists the goods in the order they'll be taken off the shelves (is it a 64?

You must be joking – it's a pocket busting Datasab minicomputer.)

The computer allows mixed orders, so that a dealer can get deliveries of records, computers and software on the same order and in the same van. That's a major plus point since many record stores have now been persuaded to sell computer games.

The other plus point is that Lightning offers a 24-hour delivery service. "We can take an order and guarantee it'll be in the shop the next day." Sounds impressive? "We've been doing it for eight years already, as record distributors."

Granted, speed is a key factor in distribution – and Loretta Cohen seems to have got that sewn up. But she reckons she's

doing more than just moving stock quickly. "We're also offering dealers an advisory service which, to my knowledge, is unique in distribution. That brings her back to the computer she's so fond of.

Distributing advice

Apart from providing stock control facilities, the computer also provides a list of products she calls "fast-movers", and new products. The telesales girls can tell dealers which games are selling particularly well, especially when that game hasn't appeared on the dealer's order. They can also advise on new games which aren't available yet. Since the computer's got an extended order facility, any product not yet available can be ordered in advance, stored in memory until stocks arrive and then be despatched immediately.

At present, our girls are taking orders on all our products but we'll soon have a special team just for software," Loretta Cohen's pretty keen on that. It shows how important her department has become.

Small and regular

Generally, Lightning doesn't distribute to the major chains – stores like Boots and Dixons – because they have the buying power to negotiate their own contracts with software houses at advantageous rates. But large concerns do use Lightning for topping-up. "We can get stock on their shelves quickly when there's a rush, at Christmas, for example."

Apart from those occasions, Lightning deals only with small concerns. "We don't encourage dealers to stick themselves up with stock – we prefer small but

Ray Laren: from 48s to films to Frogger

Suppliers

How to make money wholesale

regulator orders." That's probably why some games go out of fashion so quickly.

Despite that, dealers will inevitably have stocks of games that they can't sell. "Yes, but we have a safety clause. We'll take stock back if it's not sold within 90 days and give the shop 50 per cent credit. We think that's good and fair."

Software houses

On the other side of the deal, how attractive is Lightning to the software houses? And what kind of service do they get? "Many software houses still service large retailers themselves. But they're now beginning to realize that they're better off putting their smaller dealers through a distributor, so that all their efforts can go into producing software."

Of course there's a price to pay for offloading the burden of getting games into the shops onto the middleman. "We agree on a retail price for the product [that's what the buyer pays] and take a margin, usually 80 per cent of it... but there are negotiations to be gone through." Some distributors the rate can be higher, but then, they're probably helping to promote the product themselves.

Loreta Cohen admits that the games market is now well and truly saturated. That should make her job easier, in theory, because software houses would be even more eager to sign up with a distributor in order to grab a slice of the market. "Software houses contact us 98 per cent of the time this month of them are still unknown."

Nightmare software

No only that, they invariably send samples of their wares. "I get anything up to a dozen parcels a day and it's quite a nightmare at the moment. But we do look at all of them because there may be a hot number there. That rarely happens these days." She's got more to say about that, too - but later.

Loreta Cohen doesn't do all the assessing herself, of course, and the process isn't particularly formal either. "I do a little, there are various people in the building who are interested, and we farm some out to youngsters who we know. A lot of it is done purely from gut reaction."

If the title a game's worth distributing (that probably amounts to an educated guess that it will sell), she will impose a number of conditions on the supplier. One of these is that the software house must do its own promotion. "It's no good to me taking on a title if the software

house won't promote it, that's the only way end-users are going to hear about the product."

The main criterion here is warehouse space - and that's at a premium. Loreta Cohen must make sure that her products really "move". The art of distribution lies in buying and selling quickly; keeping those storage overheads down.

Distributing Commodore

Lightning now has an official Commodore distributorship which means that it deals in hardware and peripherals too. "That's become an important and significant part of the business this last year," enthuses Ms Cohen.

But she qualifies that enthusiasm a little. "A year ago, Commodore was impossible to deal with. And at one stage, the general feeling here was that we shouldn't stay with them. The major problem was getting supplies and product details. Fortunately the situation seems to be improving."

In any case, Loreta Cohen has a great deal of praise for Commodore software. "We sell a great deal of it and it doesn't cause us much effort. The ROM-based games offer very good value. International Soccer, for example, we sold 2,000 copies in a week."

But Commodore stands apart from many independent software houses by having such a diversity of titles. "Yes, that's probably the secret of their success. Their 'O' and 'A' level courses and the home stuff doesn't sell in terrific volumes but they're steady movers. And there is very little in the range I could say was a bad seller. That must be mighty pleasing if your main concern is getting stock off those shelves."

On the hardware front, Lightning acts as distributor to retailers not big enough to have a Commodore dealership themselves. Obviously,

Commodore prefers to shift stock in large volumes, leaving the distributor to supply smaller concerns.

But Loreta Cohen feels she can do that job better than Commodore.

Market views

"Because we call on dealers with other goods, we can offer the same 24 hour service for hardware and peripherals. Dealers pay us a little bit more and get their goods immediately rather than waiting for an uncertain delivery date from Commodore." Anyone who's ever waited for a Commodore delivery would nod sagely in agreement.

Loreta Cohen has been in software distribution long enough to be able to make some comments on that rapidly expanding yet notoriously unstable games software market. Lightning itself has learned a few lessons since it started getting involved in the area way back in 1978. It primarily dealt with video software, then mainly for the Atari games machines. The market now has shrivelled and Loreta Cohen has no doubts about the reasons. "They went on and on producing the same kind of games and killed their own market."

In the home computer market heading in to that same self-destruct mode? "This year has got to see a shaking-out period. The market is saturated without doubt, and the established software houses are aware that they can't keep on producing repetitive titles. Quality, value and technical depth have got to improve."

But that doesn't mean the games market will eventually cease to exist. As Loreta Cohen points out, "people will always buy games." Her problem is making sure the games they buy are the ones she's distributing and that problem gets larger by the day.

Lightning is currently stocking a small amount of business software for the Commodore 64 and Spectrum, because dealers have been asking for it. That seems to bear out the general feeling that people want to do more with their machines than just play games. "It will become an expanding part of the business but it's going to take a lot of looking at as far as we're concerned. We just can't afford the shelf-space, room is at a premium."

Be it looks as though Lightning must look more closely at the software market and assess products more stringently. Not only that, Lightning itself is going to produce own-brand software - following in the footsteps of Virgin and K-Tel, no doubt. "I can't say much at present but we won't be launching more than six titles per year, and they're going to be good and original."

But will Loreta Cohen insist that her own products measure up to the standards she's now setting? "Certainly, I'm going to practice what I preach. That's why it's taken as long as it to get off the ground." Obviously her concern with market saturation doesn't extend to Lightning itself. Time will tell...

Loreta Cohen: she gets a lot of parcels

CBM 64— VIC PRINTER

For only £79.90 fully inc!

"Very good — and good value too" Commodore User Review Dec 1983. Probably the world's cheapest Vic/64 Printer, but better print quality than printers 3 times the price! Put the superb ALPHACOM-32 Printer on your Vic/64 using the

SOFTEX PRINTERFACE

Printerface alone only £20.95 fully inc!
Alphacom system complete only £79.90 fully inc!
Vic Wordprocessor package only £3.95 fully inc!
(84 version T.B.A.)

- Alphacom-32 printer already established in W.J. Smith, John Mezzano — £2949.95
- Prints in blue or black on economical white paper (max 1.5p per sheet)
- Very robust and hardwearing! Gives consistent, high quality print.
- Rises but fast — up to 90 characters per second.
- Full Vic/64 graphics as well as user defined characters
- 64 column printer with superb formatting facilities
- Excellent high resolution graphics
- Operating commands same as Commodore Vic/64 printer
- Works on Sinclair's ZX-PRINTER (Needs ZX-power supply) — £5.95 fully inc!
- Fast delivery — friendly backup — simple to use!
- Not a plotter, but a fast dot-matrix printer

So what's COMAL?

An introduction to an unheralded language

by Brian Grainger

'COMAL' is short for COMMon Algorithmic Language. In some quarters it has recently come to prominence as a serious contender to Basic as the programming language for microcomputers. The aim of this article is to give you an idea of why that should be - to explain how, when, where and why COMAL came about: and to introduce the main facilities of the language.

COMAL started life in Denmark as the brainchild of one Borge Christensen. It has been understood for many years that Basic may be an easy language to learn, but it's one that leads to programs which tend to be difficult to read and understand and consequently Basic programs are difficult to modify by anyone but the original author. And, even then after a period away from the program the author may well find it difficult to understand.

One solution to these problems is structured programming and the use of languages that are well suited to this technique. In the top-semester world, Algol was probably the first language to be used for this purpose. Pascal became popular on microcomputers.

But, both of these suffered from the same problem - they were (and are) quite difficult to learn, and they were (and are) very unforgiving to programmers who did not follow the strict rules of syntax.

The purpose behind COMAL, then was to combine the simplicity of Basic with the power of Pascal. The aim to produce a language that was easy to learn but produced understandable programs.

During the late 70s COMAL was developed extensively, until in 1982 a definition of COMAL called the COMAL Zerkal had been agreed. This standard whatever computers uses COMAL. The main lines of COMAL were in education, but as with Basic, the COMAL language - and in particular the Commodore versions of it - has become quite generally accepted as a language for business applications as well.

Editorial facilities

Let's look at COMAL in a bit more detail. And to start, we'll take the process of general

manipulation of programs. In Commodore Basic you enter programs by giving a line number followed by some combination of characters which hopefully give a meaningful Basic statement. I say hopefully because no check is made until the program is RUN. To delete lines, you type the number of each line to be deleted followed by 'return' every time. This can be a laborious process if a block of lines is to be deleted. (Of course certain facilities have been added to Basic by various 'toolkits' usually at the expense of program speed.)

By contrast COMAL has as standard AUTO line numbering facilities built into it: there's a RENUMBER command and it has the ability to erase whole blocks of lines by a DEL command.

The most significant aid to program input that COMAL offers whoever is syntax checking with COMAL is impossible to enter a program line which does not make sense. Any error is flagged immediately and a pointer is given to where the error might be. The cursor waits at that point so you can easily change the line. This means that before a program has

been run you know that all the lines are correct from a syntax point of view.

Structured programming

To understand why COMAL is a useful language you need to know what structured programming is all about so here's an instant introduction.

It has been shown that any computer program can be built up from three types of structure. First, there's sequence structure: a series of statements that follow one another in sequence WITHOUT jumps. The Condition structure is typified by the IF... THEN construction: if the statement is true THEN execute one block of instructions ELSE perform a separate block of instructions. And third, a Loop structure is exemplified by WHILE statement is true DO perform a block of instructions.

To enable long programs to be built up from combinations of short ones, a segment structure is also useful.

While all these can be synthesised in Commodore Basic by judicious use of the GOTO statement and the limited

structured commands available COMAL provides all the basic structured commands as well as some additional ones to make programming even more straightforward. Only in very rare instances is a GOTO statement necessary in COMAL, so thus the spaghetti-like nature of some programs can be eliminated.

Together with the facility to segment programs and the ability to give variables sensible names rather than two letter codes, this helps the user to write readable and understandable programs.

Conditional statements

Commodore Basic supports only one type of conditional statement, the IF THEN statement. And this does not even conform to the basic condition structure. COMAL supports the full IF THEN ELSE ENDIF syntax, it also extends it to multiple condition structures in one of two ways: using multiple IF structures by use of the ELIF (ELSE IF) command, and using the case structure.

The following example for ELIF shows how a test between two numbers can be done in COMAL and Basic, COMAL using the IF... THEN ELSE construct and the equivalent Basic with GOTO carrying out the same operation.

As for the CASE structure, here's an example of its use.

I will leave an exercise for the reader to try and write the above in Commodore Basic. The simplicity of COMAL will be immediately apparent if you try it.

Loops

Commodore Basic supports only one type of statement to perform loops, the FOR... NEXT construction. Once again this does not fully answer the basic

requirement of a loop statement - which should allow any condition to be tested before deciding whether the loop is executed or not. To do this in Basic requires the use of multiple IF and GOTO statements.

COMAL has three types of loop. First, it supports **FOR...NEXTFOR** - identical to the FOR...NEXT in Basic, except that in something like **FOR I = 1 TO 10 DO PRINT I** the PRINT I will not be executed at all. In Basic the instructions are executed at least once, which is usually not wanted.

Secondly COMAL has a **REPEAT...UNTIL** which allows a group of instructions inside the structure to be executed repeatedly until a set condition is true. The truth test is carried out at the end of the instructions, so they are executed at least once.

There can sometimes be inconvenience, though, and so there is a third type of loop in COMAL, the **WHILE...ENDWHILE** structure. This is identical to **REPEAT...UNTIL** but the truth test carried out before executing the instructions. So if the condition is true at the start the instructions will not be executed at all.

Here are some examples of loops in COMAL, with the equivalent Basic statements.

See how the COMAL version's use of **WHILE** and **REPEAT** make the program much more readable. You will also note that

with the Basic equivalent of **Repeat** the IF test to get out of the loop is the opposite of what is really required - which doesn't lead to easy understanding of Basic programs.

Procedures and functions

This topic probably needs a complete article by itself, so I will only hint at the possibilities of COMAL in this area. Commodore Basic has a **GOSUB** and **DEF FN** to facilitate writing of the subroutines. They are woefully inadequate. **GOSUB** does not allow parameter passing and it is restricted to line number identification instead of a meaningful name. **DEF FN** will work only for functions that can be defined in one line.

But COMAL procedures are named so that they can be made instantly meaningful - **GET 'NUMBER, PRINTOUT** for instance.

The second important feature of COMAL procedures is that parameters can be passed. This means that a procedure can be used with one set of input/output variables at one time and a completely different set at another. Procedures can also be made **CLOSED**, which is rather like building a brick wall round them. Any variables used in the procedure cannot be confused with those of the same name outside the procedure - very useful if you bump your

programs using lots of standard subroutines. Procedures in COMAL can call themselves indefinitely until the memory space runs out. Basic is limited to about 23 recursive calls. Procedures can be used to add new commands to COMAL, too.

COMAL functions have all the advantages of procedures but return a single function value. Unlike Basic your function definition can be as long as you like.

As an example of a COMAL procedure here is one which will add the command **CURSOR(row, column)** to a Commodore 4032. The effect on calling the procedure (as in **CURSOR(5,10)**, for instance) will be to move the cursor to the given row and column.

Additional features

From the example it can be seen that there are features of COMAL which do not exist in Commodore Basic. There are others. For one the **END** function has been extended to provide an easy method of getting a random integer. Two new arithmetic operators, **DIV** and **MOD**, have been added as well.

In the above examples line indenting is used to identify the structures easily. This is all automatic: the user does not have to type the additional spaces. Other things are automatic as

well. The colon in assignment statements such as **A = B** need not be typed. **NEXT** can be typed instead of **ENDFOR** if automatically generated, a number of command abbreviations exist (like for **PRINT**, **1** for **REM**, **2** for **FILE**) and the full form will be automatically provided by the system.

Disk handling has been easy with COMAL. The **PASS** command will allow all the file handling commands to be used without having to control a command channel. Disk directory listings can be obtained at any time without losing programs in memory. **STATUS** will read the disk error channel automatically.

The cartridge version of COMAL for the Commodore 64 will have subunit commands to control the graphics and sprays.

COMAL	Basic
8018 IF A = B THEN	10 IF A = B THEN

TUNNEL SOFTWARE

COMMODORE 64 EXTENDED BASIC

This package comes in the form of a cassette and a thirty page instruction manual. It is designed to allow the Basic programmer to make full use of the advanced sound and video Interface devices built into the computer and at the same time provide useful utilities. An assembler has been included as an integral part of the package so that the advantages of Basic and machine code can be intermixed in one program.

LOADING: the cassette contains the program which has to be loaded into the computer before any of the new commands can be used. This is done simply by pressing SHIFT and RUN/STOP together or by typing LOAD. Either way, the program will load from the tape and automatically run so that it is now ready to be used. To save time when loading the program a TURBO loader is included. This is a small program which loads itself into the computer and then loads in the extended basic in a mere forty-five seconds, (as fast as if it were loaded in from a diskette). This does NOT mean that another program has to be loaded in first, all the necessary loading is fully automated once LOAD has been typed for the first time.

LOCATION: once the program is loaded, it will position itself in the memory behind the resident BASIC ROM and several other smaller places which are not normally used by the computer. This means that the program will only take 2.5K away, leaving 35.5K available for the storage of a BASIC program. The extended basic is 16K in length and is located from \$9800 to \$D900 hex. It does not replace the original BASIC ROM. All the new commands work in addition with the existing basic, however, any small pieces of software enabling the computer to be used with non standard printers, etc will not work.

INSTRUCTION MANUAL: provided with the program is a thirty page manual which explains how to use each command separately and in conjunction with other commands. An understanding of Commodore Basic is assumed.

GRAPHIC commands: the package allows the selecting of display modes and storage of one text and one graphic screen at the same time. There is a full set of colour and drawing commands which enable the drawing of dots, lines, solid rectangles and solid triangles. Five powerful sprite commands are included which enable fast sprite manipulation and definition.

SOUND commands: there are four sound commands which combined form an extremely powerful synthesiser. This section is designed to make music at a higher level than the BBC micro, for instance the pitch of a note can be represented using the standard notation 'C#5' as well as number form. This allows music to be written and debugged with much ease. All the functions of the sound device are incorporated into the new commands, as well as the software music and frequency modulation techniques.

STRUCTURED PROGRAMMING: there are five commands added to assist in this field. This includes the well known PROCEDURE commands which allows second generation subroutine nesting.

UTILITIES: provided are commands for accessing the disk drive, copying the screen to the printer, defining the function keys, program line deletion, and other useful commands such as RENUMBER which will renumber a program including goto's, gosubs, on ... goto's, etc

ASSEMBLER: the three pass assembler acts in the same way as the assembler resident in the BBC micro. The source code is contained in the BASIC program and is assembled using one of the commands.

There are in total FIFTY ONE extra multifunctional commands as well as the assembler contained in the package. The cost including postage, packing and VAT is £14.95

All our programs are recorded with a TURBO LOADER. This means that they will now load as fast as disk.

**Tunnel Software, 338 Tunnel Avenue, Greenwich, London SE10 0PF.
Telephone: 01-858 0837**

facilities as well. Facilities to control the sound will be an option.

Availability

The question you should now be asking yourselves is where you can get your hands on COMAL! Well, various versions exist depending on the computer used. COMAL has been distributed in the UK as a public domain program for about two years now, and it has been used

by such diverse areas as training colleges, ITECs and dental surgeries. There are implementations for 4032 and 8032 computers with 4040 and 8080 disk drives. An extended version is available as a public domain program for the 8086 and 4040/8080 disk drives, and this is also available as a ROM board for other Commodore Pet series computers.

COMAL for the Commodore 64 made its appearance this year. The public-domain version will work with disks or cassettes. A variant has been produced for

those people, mainly in Education, who have a network of 64s attached to a single disk drive. The extended cartridge version for the 64 is expected to be available early in 1984.

To obtain a public domain version of COMAL send a disk or cassette (disk only for Pet versions) with return postage and details of computer and disk used to me at 23, Minehead Way, Stevenage, Herts SG1 2NZ. Please mention that you heard of COMAL through this article. The

COMAL semi-compiler, some sample programs, notes and details of COMAL manuals will be sent.

The ROM-board version of COMAL and the Commodore 64 cartridge (where it appears) can be obtained through UniComal Denmark APS, Christiansholmsgade, DK 8700, Horsens, Denmark.

73 MINEHEAD WAY,
STEVENAGE, HERTFORDSHIRE

Write away

This is your page normally we write for you, but here we listen. Feel free to let us know what you think - about the magazine, about Commodore, about suppliers, about life, art, the meaning of existence or whatever. We don't print everything we receive, of course but anything that might be of specific relevance or general interest will make it to these pages.

Vic-10-64

I have a Vic 20 and am shortly getting a Commodore 64. Do you know if there are any programs available which will let them "talk" to each other via the user ports. If not, would it be possible for you to request to publish one (also a program for using a modem) as I'm sure there are many people like myself who are buying a 64, but still hanging on to their Vic and would find this program useful.

Mr. A. Markier, 138 Cleeveham Lane, Sutton, Surrey SM1 2NG

I regret we have been unable to find any advertised programs for combining a Vic-20 and a 64 (if anyone else knows of one - let us know).

There are a number of programs to run Pets with either machine, since the Pet lacks both sound and colour facilities; there is good reason therefore to want to use the preceding power and peripherals of the Pet with the sound and colour facilities of the Vic-20 or 64.

Unfortunately the same reasoning does not apply to a Vic 64 link, since the 64 has virtually everything the Vic has - and more! One reason why you might want them connected is for a two-player, two-machine game; this would require some knowledge of the information that had to be passed between the machines.

Basically, there is no technical reason why the two machines cannot be connected; it is more a case of why they need to be connected. For example, the software to run an 'alternative move' game would be different (and less complicated) than that required

to have the two machines fully interactive.

To use a modem requires an RS232 interface unit in addition to the appropriate software. Interfaces and modems for the Vic are readily available; the cheapest probably being the kits from Maplin Electronics. The 64 should be able to use the same hardware there, but the software will be different.

To give full details of how to get the two machines talking to each other would take more space than I have here, but perhaps the Editor will take pity and publish a full article for just this purpose perhaps with a few hints on converting a Vic modem program to run on a 64. How about it, Ed? OK. article now commissioned - Ed.

Program searching ...

Some three years ago I had the dubious pleasure of landing in hospital for a couple of weeks, fortunately I also had the pleasure of making the acquaintance of a Vic-20, and of course its owner who happened to be one of the only two people on the ward. He had brought his own TV and had got the stall to agree to let him spend his spare time programming. After I had shown some interest in the computer he agreed to let me finish the program he was doing.

I cannot remember the name of the program or for certain the name of the magazine, but I have a feeling it was *Vic Computing*. The program was one based on characters from Lord of the Rings.

Do you have any idea what the program was called or when it was published?

A.D. Pierce, Bampton.

Sorry, nothing to do with us in our *Vic Computing* days. Any readers recall this thing?

Comments and query

I have recently purchased my first copy of *Commodore User* and I am duly impressed. Could you please inform me as to the cost of obtaining back issues.

I hope that you bear the consumer in mind when you offer

products, unlike some of your competitors as I am still awaiting a reply regarding a bad tape purchased from 'Commodore International' August 1983 issue. This sort of bad practice makes one rather reluctant to place regular orders for magazines.

I have two grumbles regarding most other mags which perhaps your ed may bear in mind. I learn a great deal and get a lot of pleasure from magazine listings (accurate ones). But why do some mags print so small that it is almost impossible to read? Commodore symbols are not the easiest things to read as the best.

Please, dear ed, remember that we are not all experts, but some of us are quite ordinary folk who derive a lot of pleasure from our hobby of computing. What may seem a simple operation to you professionals can be a very frustrating problem to us beginners.

You also asked what we readers think of Commodore. Well, I think their back-up service is lousy. I joined the VicSoft Club in October 1983 and am still waiting for my disk box which was offered with £5 membership, also the VicSoft Catalogue would seem to be a bit of a rip-off since the cost of the software is the same as my local computer shop plus 50p for p&p. That means that four items cost me an extra £2, some benefit for paying £5 to join the club.

Could you also help me with a frustrating problem which possibly has a simple answer. How is the following symbol generated on a CBM 64? [Z]

Thank you for your patience in reading my letter. But you do ask what we thought. Keep on producing a good magazine and I will keep on buying it.

Derek Rawnsley, 9 Saltergate Road, Messingham, Southorpe, South Middlesbrough DN17 3SL.

We don't think there is a character like that. The nearest we can think of is the back slash - PRINT CHR\$(109), POKE 77 into a screen location, or hit shifted M on the keyboard.

Recovery tip

There is a way to regain control of the Commodore 64 after you experience the keyboard lockup upon deleting a character on the bottom line of the screen. All you must do is press the shift key and the "3" keys. This will start the Datasets going (assuming you have one). Then hit the reset key and you have your computer back!

Scott C. Jensen, 1732 Beechwood, St Paul, MN 55115, USA.

Commentary

Some more comments on your magazine, but first a word about the Vic-64 trade-in. I too received the (standard) 'we haven't decided yet' reply from Commodore when I asked them, and that was several months ago. However, don't feel that you have to wait for Commodore to make up their mind, try your local dealer.

I would be grateful if you could give a mention in your magazine to my local Spectrum dealer, The Model Shop. Even though we went in on a Saturday (not the best time!) and even though there seemed to be more people in there than I would have thought possible (it's a small shop), their computer sales man gave us excellent service and a very good deal indeed on our Vic-20 for a CBM 64 even throwing in a bit of software with it. Full marks to them!

Now, to your magazine. Not so much an out-and-out compliment, more of a nudge. It's just that the mag seems so random. Apart from Tommy and the Games reviews, the rest just feels untidy. Don't get me wrong it is all excellent stuff. I'd just like to see a bit more structure to it.

Letter 5

Copy write

I read with some amusement your comment on an answer to a reader's query in 'Tommy's Tips' of your December issue. The question requested some clarification about acceptance of programs on to all rights' basis. The answer was, of course, that the programs then belong entirely to the magazine instead of the copyright holder and the property of the writer. Your comment was "A bit brutal perhaps, but otherwise we'd never be able to tweak or edit anything".

Has it escaped your notice that there is a huge magazine market to writers outside the computer field and that with very few exceptions this market operates entirely on a 'First British Serial Rights' basis? And that all these magazines "want or edit" as much as they like or think necessary? Are you not taking advantage of the fact that too many programmers are simply not aware of the fact of life as far as copyright is concerned? What will happen to magazines like yours when the best programmers do desert?

"A bit brutal, perhaps?" Oh no dear Editor! A bit larcenous and no

perhaps about it!

Have you the nerve and the probity to print the letter unedited? Better still, how about changing editorial policy before it's too late?

A. Gianote, 15 Asepthill Road, Aigburth, Liverpool 17.

Profirity? Wonderful word ...
The point about 'First British Serial Rights' almost invariably applies to text contributions from professional writers, and anyone who wants that kind of arrangement with us gets it - most of our columnists work on that basis. But our magazine always carries a panel stating "Material accepted on an 'all rights' basis unless otherwise agreed". And "unless otherwise agreed" actually does mean "unless otherwise agreed".

I stand by the comment. We must have the legal freedom to amend programs as required: that at least was what our solicitor said. On the other hand, we don't normally enforce it, care to think of it. Anyone wants our permission to use something we print, we tell them it's ok if the author agrees. And we never stop

authors resending material they've submitted.

Incidentally, we did not edit this letter - offensive though we found it. And on the subject of legal niceties, it's libel to call someone 'larcenous' without evidence of deliberate theft. We look forward to losing your subscription custom, dear Mr. Gianote.

DTL Basic confirmed

I noticed that a review was done in *Commodore User* December on the DTL Basic Compiler. I want to support Chris Durham (who did the review) wholeheartedly in his summary "doesn't match up to claims or price". As a matter of fact, I would like to add that I feel that these people didn't do their homework or their debugging properly, if I had to write a program like that, my boss would fire me straight away. I think Mr Durham was actually very kind in his review. I would have used quite a few more explicit and hairy expressions.

Albert van Arsdit, 13 Langlaagte Street, Keldalberg 2400, South Africa

PANegyric

I feel I must draw your attention to a book called *Silly Programs* for the Commodore 64 published by Pan at £5.66.

After many tedious hours of typing, checking and debugging programs from this book we find many either crash or don't run at all. One program (18 pages long) has a GOTO command for a line which doesn't exist!

We are extremely angry that these programs are not checked and run before being published and sold to the public.

I am writing to you in the hope that you will print a warning to other frustrated users who are most probably tearing their hair out trying to find out what's wrong.

Mrs. B. Carter, 14 Brookside, Waltham Abbey, Essex EN9 3JR

For example, I'd be all for an Adventure section. When I had a Vic, the only Adventure programs that I could buy and know that I'd be getting quality stuff were the Scott Adams cartridges. Apart from that I hadn't a clue. With arcade games you can tell its quality from a few minutes play, you can't with Adventures.

Also, why not sections for beginners and at the other end of the scale machine-code buffs?

If you had sections for the different parts of the computing world like this, perhaps people would be able to identify more with the magazine I know I would.

Andrew Dille, Cairngorms, Rake Lane, Witney, Godalming, Surrey GU8 5NT

It isn't plead enough for an Adventure section. Please, please, please!

Well, we do have a structure to the magazine ... even if it doesn't look like it! For instance, we always plan for the following:

Vic Section

- games reviews
- *Fourth on the Vic*
- book reviews
- *Victims*

64 Section

- *business (usually WP)*
- games reviews
- book reviews
- *Victims*

Other stuff, may be Vic or 64 news pages

- *Tommy*
- *Butterfield*
- non-games reviews

- *not machine-specific*
- *aspirin profile*
- letters
- competitions

As for a regular Adventure section, we'd love to carry one. Problem is, we don't know of anyone who could write it - so one in the office is an Adventure out. Any volunteers?

Kind Words about Stack

After reading the tribute to Stack Computer Services in the February

edition of your magazine it seems to me reasonable to add my little tribute to Mr Jeff Orr and his thrusting (and at the same time caring) organisation.

I recently had a small problem getting a printer to function. It was in no way the fault of the small interface supplied by Stack but I wrote to them in search of advice. A few days later I had a phone call to my home from Stack at Leverpool. The person I spoke to was charming, infinitely patient and extremely capable. He spent a good deal of time dealing with, first my total ignorance in computer matters and second supplying the solution to a problem which was not directly his concern.

After putting the phone down I realised that I was not clear on one small point. I phoned Stack at the number my unidentified caller had given me but found nobody really able to help me. All efforts to identify my mysterious caller failed and it was only when I wrote to the company again that it emerged that my contact had been Managing Director Jeff Orr himself who was quite prepared to supply all the help required without charge.

As chairman of a 50 year-old

company myself I cannot help feeling that the computer industry has an assured future with people like Jeff Orr in the vanguard.

Peter Bonar, Thorstoe Construction Co, Meadale Industrial Estate, Thornaby, Cleveland.

BLAGGER tip

A tip for those of you with the excellent *Blogger* by Alligata for the 64, who find it impossible to get past sheet 1 and wonder about the rest. Try sharply tapping the space key whilst the title screen is showing (this gives you five lines) then press CTRL and key A through Z to play other sheets.

A.M. Adams, 72 Brierley Lane, Bradford, West Yorkshire

Dreamer or superstar... Only you can prove it

Do you have the talent and drive to be a Rock 'n' Roll idol ...

You've got a lot of energy, a bit of money and a great future. But can you stay the course, stand the heartbreaking disappointments, fraud, scandal, even arrest? Can you capture the hearts and wallets of the public and make it to the top?

How would you start? Go busking for a month or hire a manager?

OK ... But do you really want to give a fat percentage to a manager? Will he look after your interests or his own?

Why not try a tour ... Not enough cash? You don't even have any popularity. Better be careful, at this rate you won't even make a 'has been'.

Rock 'n' Roll is the new Commodore 64 version of the famous Spectrum game. But times change and now it's even harder to succeed in 'Showbiz'.

NOW AVAILABLE FROM YOUR MAIN SOFTWARE RETAILER.

Single-line Competition

February one-liner winners

Our favourite Italian program cruncher does it again with a snappier one-liner than anything Philip Marlowe could come up with. Filippo manages to put Johann Sebastian's C Major Prelude onto one line.

Shame on those who didn't spot the deliberate mistake. You can't get an 88 character line on the CBM 64 though you can on a Vic!

And please next time, no random avant-garde electronic garbage all over the screen!

* Mark Cousins of Acklam,
Middlesborough
attractive enough pattern, but is that all it does?
02-52-x-2-512-286-186 2x2-28 IPX-ZCH28007

★ **Anthony Boyd of Manchester**
- generates prime numbers up to 65000 (more if you change the number at the beginning)

★ Ian Logan of Aberdeen
- perhaps excessively accurate loan repayments calculator

★ **Filippo Pozzi of Voghera, Italy**
- eat your heart out, JSB!

★ A.M. Simnett of Sheffield
decimal-to-binary converter

Write a one-line program

No real restrictions, though we do ask for original offerings — and do use the form below! But you can use Vic or 64 and on the Vic you can assume any memory size and/or the Super Expander if you want.

If you want to submit more than one entry, you're welcome to do so; at least one of them must be on the form, the others should

be on a separate sheet with your name and address on the sheet

The five best entrants, those with programs that do as much as possible in a single line, get Fame, Exposure, Success, and a sweatshirt (not necessarily in that order).

SINGLE-LINE COMPETITION

Entry:

Name: _____

Address:

Preference: ☐ Commodore User ☐ Vic Computing Programs written for: ☐ Unexpanded Vic
Size: ☐ S ☐ M ☐ L ☐ XL ☐ Vic with expansion
☐ CBM 64

Send to: Competition, Commodore User,
The Metropolitan, Enfield Road, London N1 5AZ.

APRIL 1984

BACK ISSUES

If you do not have a complete set of Commodore User back issues, then you are missing out on all kinds of goodies

At time of going to press we have in stock Copies of all issues to date:-

Volume 1 Issue 1,	October 83
Volume 1 Issue 2,	November 83
Volume 1 Issue 3,	December 83
Volume 1 Issue 4,	January 84
Volume 1 Issue 5,	February 84
Volume 1 Issue 6,	March 84

Price per issue inc. postage

CHEQUES: Please make payable to Commodore User

UK	£1.00
Europe	£1.50
Outside Europe	£2.50

Available from:

The journey of your life... or death!

Like the explorers of old, your path lies through an uncharted world. A forbidden land, ridden with Plague Pests, guarded by lethal Robo Crabs and defended by a powerful Alien fleet.

You stand alone against these evils, your only defence your trusty, fast firing laser gun and raw courage

This is your mission, there is no turning back. For you, survival lies in victory alone

Have you got what it takes to face this lone quest and complete your mission against all the odds?

Odyssey is an all new, fast action, machine code game. It features superb graphics, twenty one levels of play and five different screens.

NOW AVAILABLE FROM YOUR MAIN SOFTWARE RETAILER.

Increase in speed	BM1	BM2	BM3	BM4	BM5	BM6	BM7	BM8	10K Prog	Sprites
PETSPED 64	30	10.9	2.8	2.8	2.9	3.4	4.3	1.2	5.2	2.3
DTL-BASIC 64	1.2	3.4	2.0	2.0	2.1	2.0	2.1	1.1	1.6	1.7
DTL-BASIC 64 with integers	5.0	3.2	5.5	4.7	4.8	4.8	5.16	1.15		

DTL vs PETSPED

I would be grateful if you would give me the opportunity to comment upon your comparative review of our product DTL BASIC 64 and our computer PETSPED 64 in the December edition of *Commodore User*.

The essential conclusion of the review was that although DTL-BASIC has many advantages over

PETSPED it is more compatible with CBM BASIC. It produces smaller programs it can compile extensions to Basic, it is compatible with existing machine code sub-routines, it has no trouble compiling large programs - these benefits are overshadowed by the apparently poor speed improvements that can be achieved and cites the standard benchmark results to back this up.

The review mentions that DTL-

BASIC has a feature to enable integers to automatically convert floating point variables to integers but concludes that their use would not have much effect and would require amendments to the source code. It is this point that I would like to take issue with.

All that is necessary with DTL-BASIC to achieve the full performance improvement is to add a single compiler directive at the front of the program to tell the com-

puter which variables can be treated as integers. As you can see from the figures below the results can be dramatic rather than being slower. DTL-BASIC produces the fastest program in six out of the eight benchmarks (much better results can be achieved for larger programs).

If I may make a couple of further points as your reviewer points out, PETSPED compiled programs are generally larger than the original while DTL-BASIC programs are always significantly smaller. For many users this benefit is very significant and not only because it enables bigger arrays to be used, one user has found that the suite of programs that originally required two disks and which when compiled with PETSPED spread across three disks would fit on a single disk when compiled by DTL-BASIC. This is of tremendous value especially on a single-disk machine.

Incidentally, the end user price of DTL BASIC 64 is £95.50 not £114.42 as mentioned in your article.

DTL-BASIC 64 with integers where possible	0.3	1.2	3.2	4.3	4.5	6.5	9.8	101.2

Action Stations! The fate of millions is in your hands...

You are the Defence Commander of a major city under attack by unknown hostile forces. Desperately you try to locate their position and destroy the enemy in the air and the squads of Urban Commandos trying to penetrate your ground defences.

Suddenly another menace appears, a roving, swirling ball of neutrons defended by a guided fireball. The only way to save your Command Centre and the city is to score a direct hit from above on its vulnerable centre point.

But watch the airborne attack. Every second they come closer to your Command Centre, every second brings the city closer to oblivion...

CITYATTAK is an all new, fast action, machine code game. It features superb graphics, fourteen levels of play and seven screens.

Sections (tick one only):

[Sales](#) ☐ [Wants](#) [User Groups](#) ☐ [Penpals](#) ☐ [Miscellaneous](#)

Insertions (tick one only): ☐ 1 ☐ 2

Starting with:

[illegible]

Text of advertisement (30 words free – first word will be bold)

[illegible]

Do you require a box number (once £5 per insertion)?

Yes ☐ No ☐

Your Name:

Address:

Phone:

Total enclosed (if any):

The lack of a classified ad section in **Commodore User** is an obvious omission. So we're going to start regular Classified page and for the average reader it will be entirely FREE!

How to use the Classified Ad section.

First tick the box under which you want your ad to appear. Indicate how many times you want it to appear (one or two); then write your ad, using one word per box. The first word will be printed in **bold type**.

If you want an ad in one of the FREE sections, you can have up to 30 words — though they'll have to include your name and address.

When it stops being free,

If you want more than 30 words, each additional word will cost you 7p per insertion.

If you want a box number – that is, we collect the replies and forward them to you – that will cost you £5 per insertion. Don't bother to include the Box No as part of your ad – just tick the 'Box No' box.

When it's not free at all:

Only individuals or user groups can have a FREE ad if you're a company or some other profit-making operation, contact the Ad Department for rates (01-241 2417). That also applies if you have a product of your own to sell.

How to pay:

Cash with the order form, please otherwise your ad won't go in.

Send the forms to:

A new age has dawned
with the

STACK LIGHTPEN

It's a new, easier way to create software and it's fun too! The Stack Light Pen means freedom from the old labours of the keyboard and a new software style for the future.

Using the Light Pen means you can create programs, including games, with that extra dimension - control at the touch of the pen. With your Light Pen you can remove words or images from the screen or put them back onto it, or simply move them about the screen. You can even trigger off a series of actions on screen stopping them at will - with the touch of the Light Pen!

Already
Available
For

BBC

ATARI

VIC-20

COMMODORE 64

And it's so easy to use - simply hold it against the screen, touch the contacts and away you go!

LIGHTPEN SOFTWARE

We've already created software for you to use with your Stack Light Pen...

DRAUGHTS, GO, LIFE, CROSSWORD TWISTER, SIMON OTHELLO SEEK & DESTROY, SHUFFLER, LOST IN THE LABYRINTH and there's more on the way!

STACK LIGHT PENS and SOFTWARE are available from your LOCAL DEALER or direct from:

STACK COMPUTER SERVICES LTD 290-298 Derby Road, Bootle, Merseyside L20 8LN.
(24 HRS) Telephone 051-933 5511, Telex 627028 (Stack G).
